Note: All observations scheduled at 1200, G.C.T Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations Relative humidity averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i. e., elevation angles less than 6° above the horizon, or any obstruction above the horizon

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available.

Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of 98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G. C. T.

R More than half of the observations are from statistical values. Equipped with lithium chloride hygristor.

SOLAR RADIATION DATA

Solar radiation intensities, tabulated in langleys per minute on a surface normal to the direction of the sun.

* Values corresponding to true solar noon

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (midnight to midnight) at Huntley, Mont.

JULY 1966

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	177	401	461	448	430	453	480	358	353	446	431	425	397	381	411	355	355	432	356	385	259	432	438	349	424	430	425	401	407	417	115	389

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Huntley Exp. Station. The instrument with which they were measured has not been checked by the Weather Bureau.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

Station	Day of month																														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ s designates the type of measurement made.

DESCRIPTION of CHARTS

CHART I., A. NORMAL DAILY AVERAGE TEMPERATURE (°F. 1931-60) FOR MONTH. B. TEMPERATURE DEPARTURE FROM 30-YEAR MEAN (°F. 1931-60) FOR MONTH. Chart I-A is reproduced from Evironmental Data Service Publication "Climatic Maps of the United States". Chart I-B is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin", a publication of Environmental Data Service.

CHART II. TOTAL PRECIPITATION.-CHART II is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin".

CHART III. PERCENTAGE OF NORMAL PRECIPITATION.-Chart III is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin".

CHART IV. TOTAL SNOWFALL. CHART V. A. PERCENTAGE OF MEAN MONTHLY SNOWFALL. B. DEPTH OF SNOW ON GROUND.-Chart IV gives the total depth in inches of unmelted snowfall as reported during the month by Weather Bureau and cooperative stations. This is converted in Chart V-A into a percentage of the mean monthly total amount computed for each Weather Bureau station having at least 10 years of record. The depth of snow on ground is that reported by both Weather Bureau and cooperative stations as of 7:00 a.m. Eastern Standard Time on the Monday nearest the end of the month. This is reported only for the months December through March. The snowfall charts are presented each month November through April.

> Isolines for Charts I, II, III, IV, and V, are drawn through points of approximately equal value. Caution should be used in interpolating on these charts, particularly in mountainous areas.

CHART VI. A. PERCENTAGE OF POSSIBLE SUNSHINE. B. PERCENTAGE OF MEAN MONTHLY SUNSHINE.-CHART VI-A shows the amount of sunshine received in terms of percentage of the total hours of sunshine possible during the month. In Chart VI-B this is shown as a percentage of the mean number of hours of sunshine received. Means are computed for Weather Bureau stations having at least 10 years of record.

CHART VII. A. AVERAGE DAILY VALUES OF SOLAR RADIATION, LANGLEYS. B. PERCENTAGE OF MEAN DAILY SOLAR RADIATION.-Shown on Chart VII-A are the monthly averages of daily total solar radiation, both direct and diffuse, in langleys (gm. cal. cm. $^{-2}$) for all Weather Bureau stations which record this element.

CHART VII-B shows the percentages of the mean based on at least 5 years of record during the period 1950-1960, and corrected to the International Pyrheliometer Scale of 1956.

CHART VIII.-TRACKS OF CENTERS OF ANTICYCLONES AT SEA LEVEL.

CHART IX. TRACKS OF CENTERS OF CYCLONES AT SEA LEVEL.-Centers which can be identified for 24 hours or more are tracked in these charts. Semi-permanent features such as the Great Basin and Pacific Highs and Colorado and Mexico Lows are not shown. The 7:00 a.m. EST positions are shown by open circles, with the intermediate positions at 6-hour intervals shown by solid dots. The date is given above the circle and the central pressure to whole millibars below. A dashed track indicates a regeneration rather than actual movement to the next position. Solid squares indicate position of stationary center for period shown beside it.

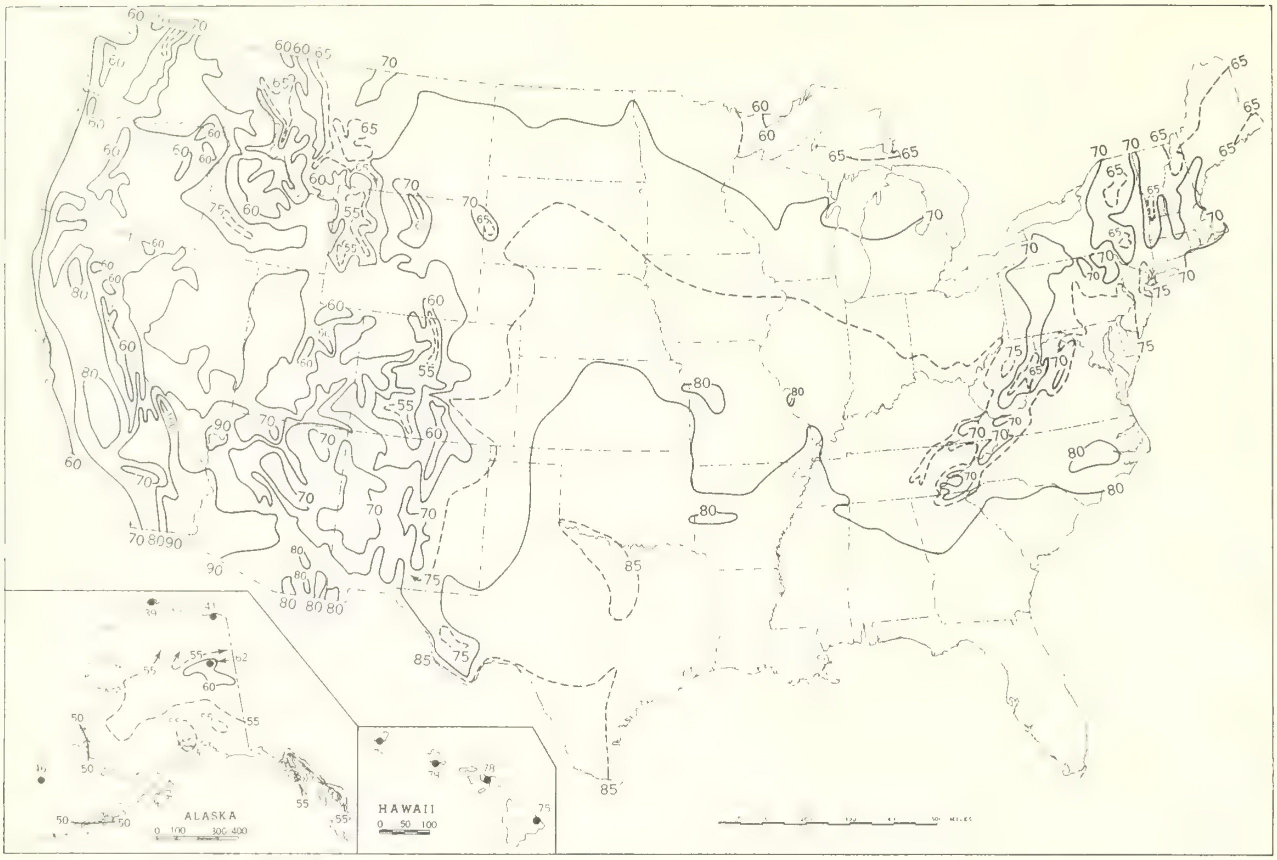
CHART X. AVERAGE SEA LEVEL PRESSURE (mb.) AND RESULTANT SURFACE WIND.-The average monthly sea level pressures are obatined from the eight daily 3-hourly observations reported at Weather Bureau Stations. Resultant surface wind directions (to 36 points of the compass) for the month are shown by arrows. Resultant speeds are indicated by the length of arrow shafts. Constancy ratios (resultant surface wind divided by average surface wind for month) are shown to two decimal places. The inset shows the departure of the average pressure based on 30-year normals for first-order Weather Bureau Stations, other stations having at least 10 years of record; and for each 10° intersection in a diamond grid over the oceans.

CHARTS XI-XVI. AVERAGE HEIGHT, TEMPERATURE, AND RESULTANT WINDS, 850, 700, 500, 300, 200, and 100 mb.-Height is given in geopotential meters and temperature in degrees Celsius. These are the averages of the 1200 GMT radiosonde reports. Wind speeds are given in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. Directions are shown to 360° of the compass. Winds are based on rawins at the indicated pressure surface and at 1200 GMT.

CHART XVII. A. 50-MB. RESULTANT WINDS. B. 30-MB. RESULTANT WINDS.-Wind speed (isotachs) in knots. Arrows show resultant wind direction. Winds are based on rawins at the indicated pressure surface and at 1200 GMT.

Exact values of most of these charted elements for Weather Bureau stations are printed each month in tabular form in CLIMATOLOGICAL DATA, NATIONAL SUMMARY. Extreme values of temperature and precipitation for each state are included in the tables, Condensed Climatological Summary. Annual averages for surface elements are presented in the CDNS Annual Issue each year.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), July.



B. Temperature Departure from 30 - Year Mean (°F 1931-60), July 1966.

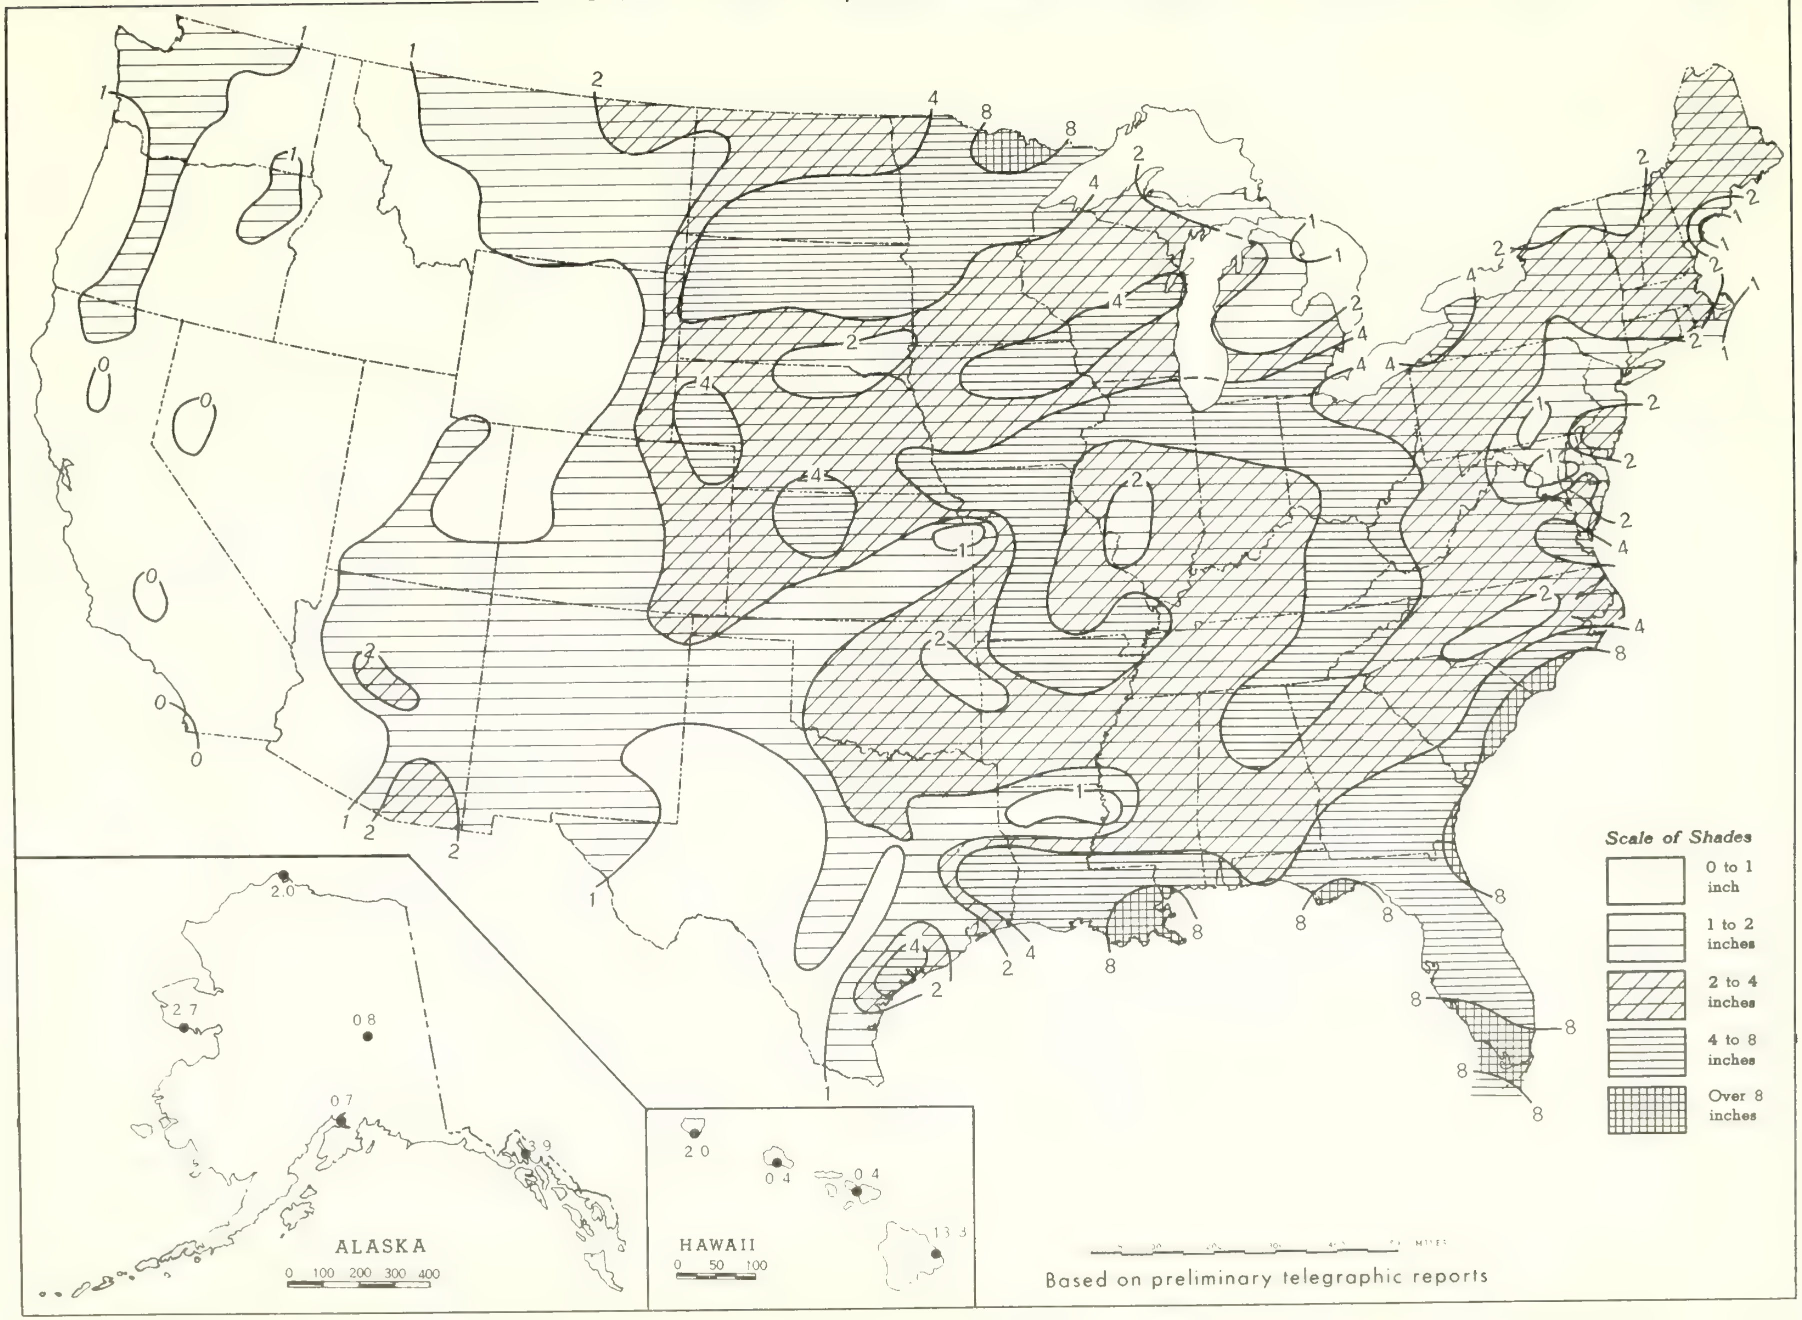
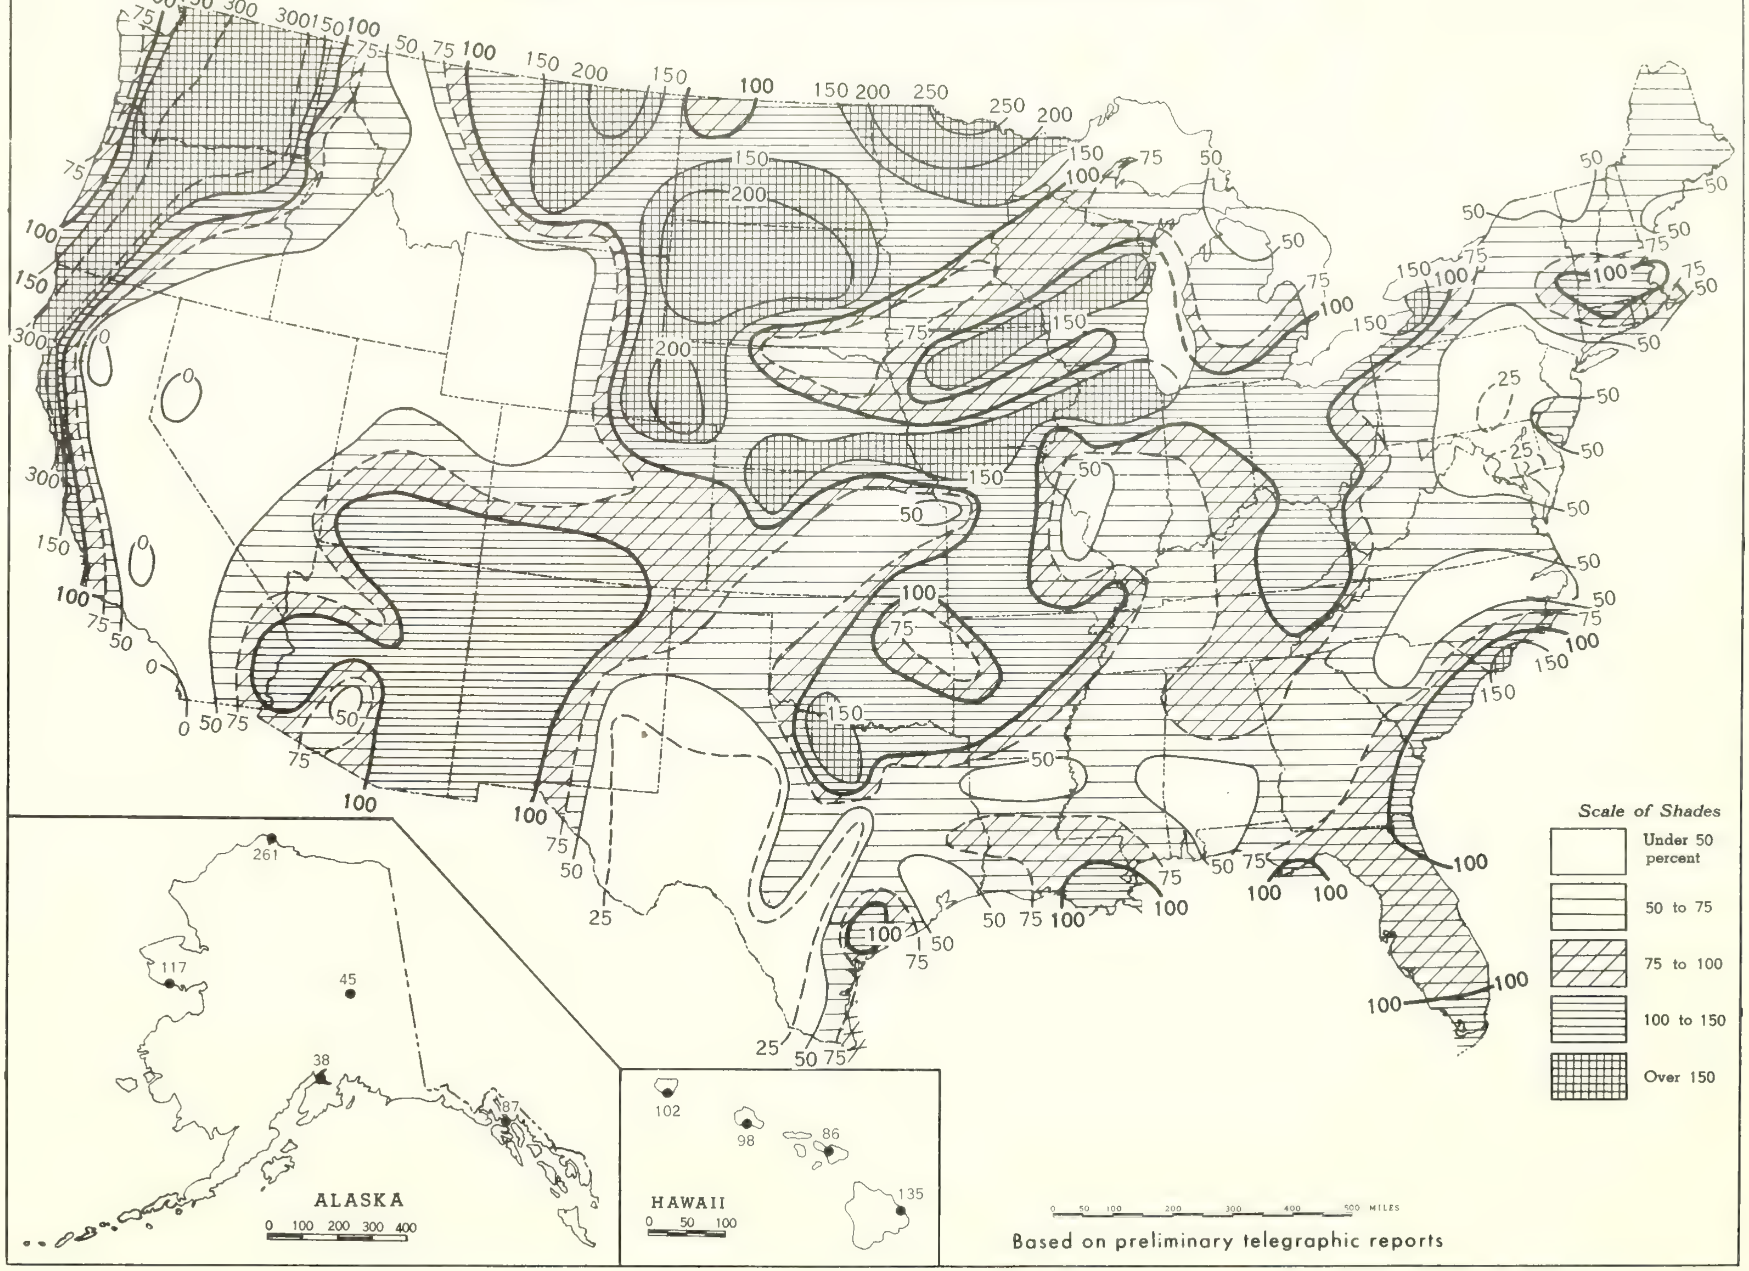
Chart II. Total Precipitation (Inches), July 1966.



Based on preliminary telegraphic reports

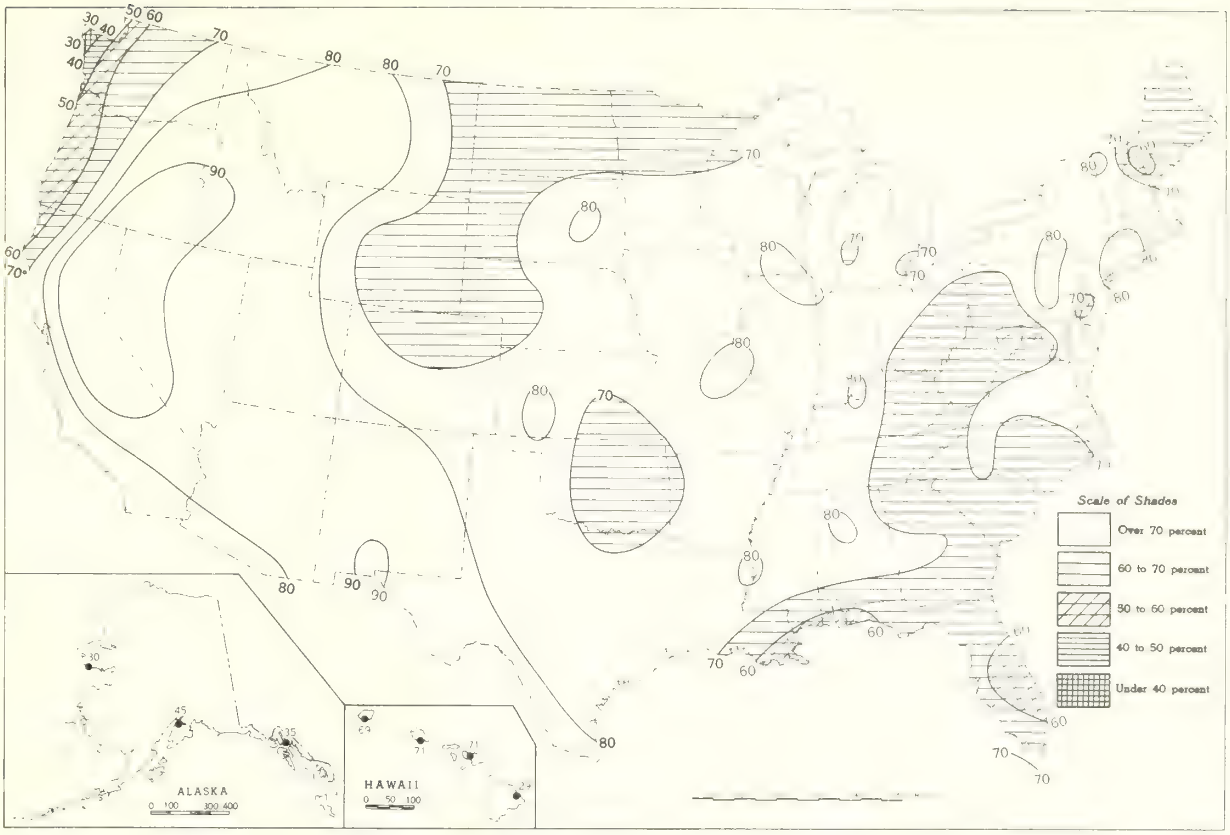
Chart III. Percentage of Normal Precipitation, July 1966.



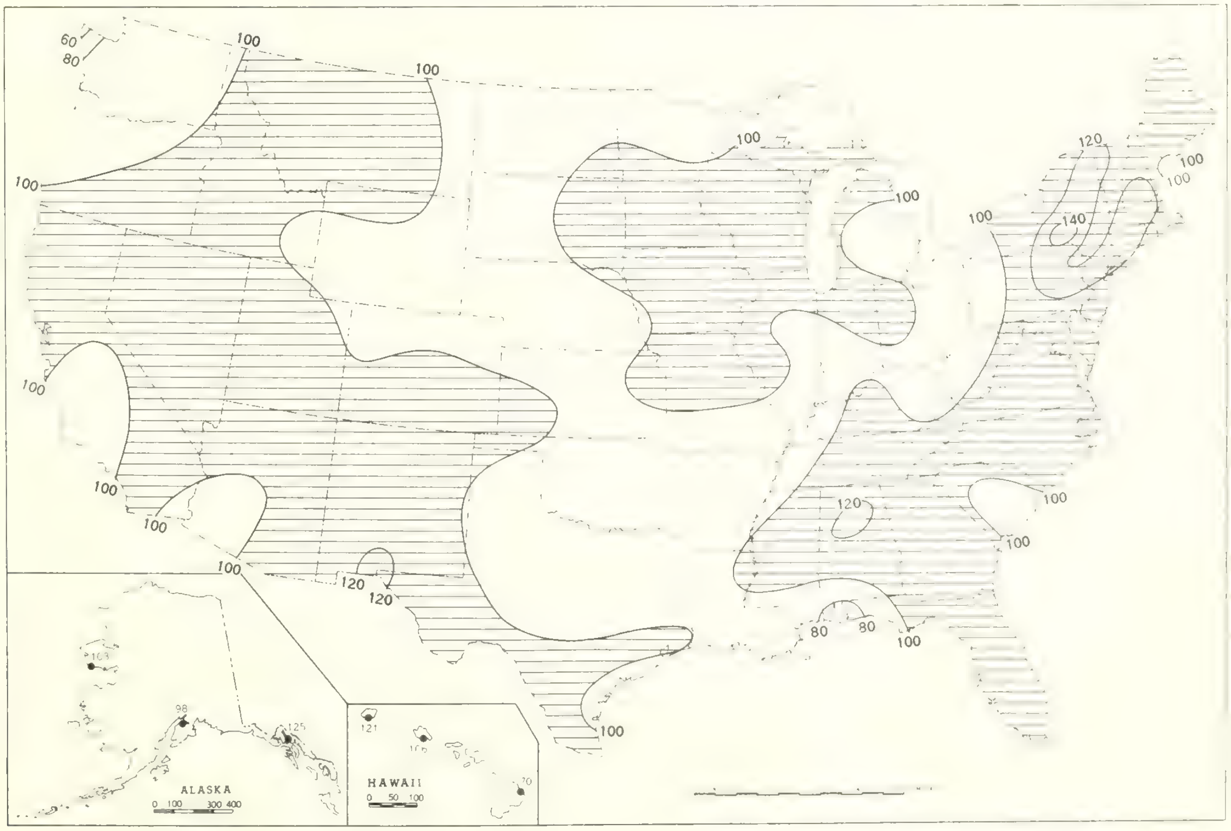
Based on preliminary telegraphic reports

Normal monthly precipitation amounts are computed from 30-yr. normals (1931-60) for first-order Weather Bureau stations.

Chart VI. A. Percentage of Possible Sunshine, July 1966.

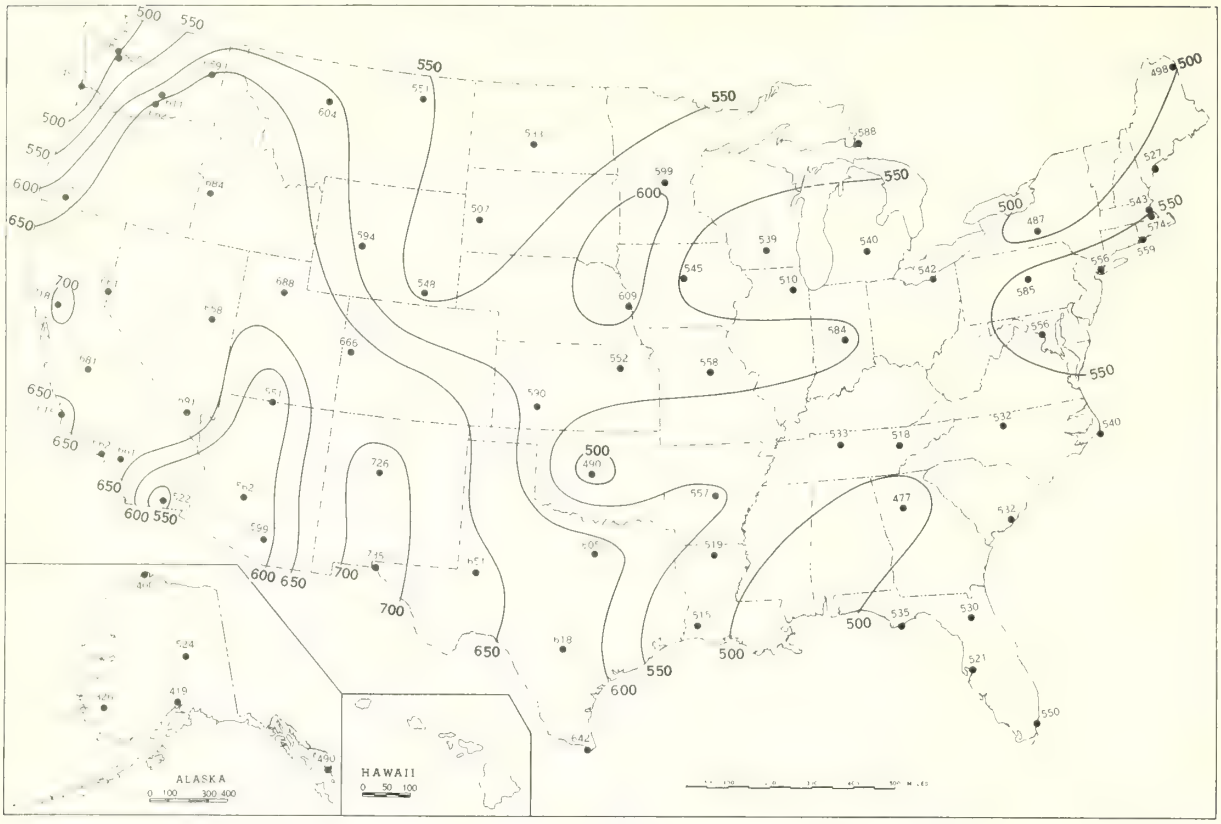


B. Percentage of Mean Monthly Sunshine, July 1966.

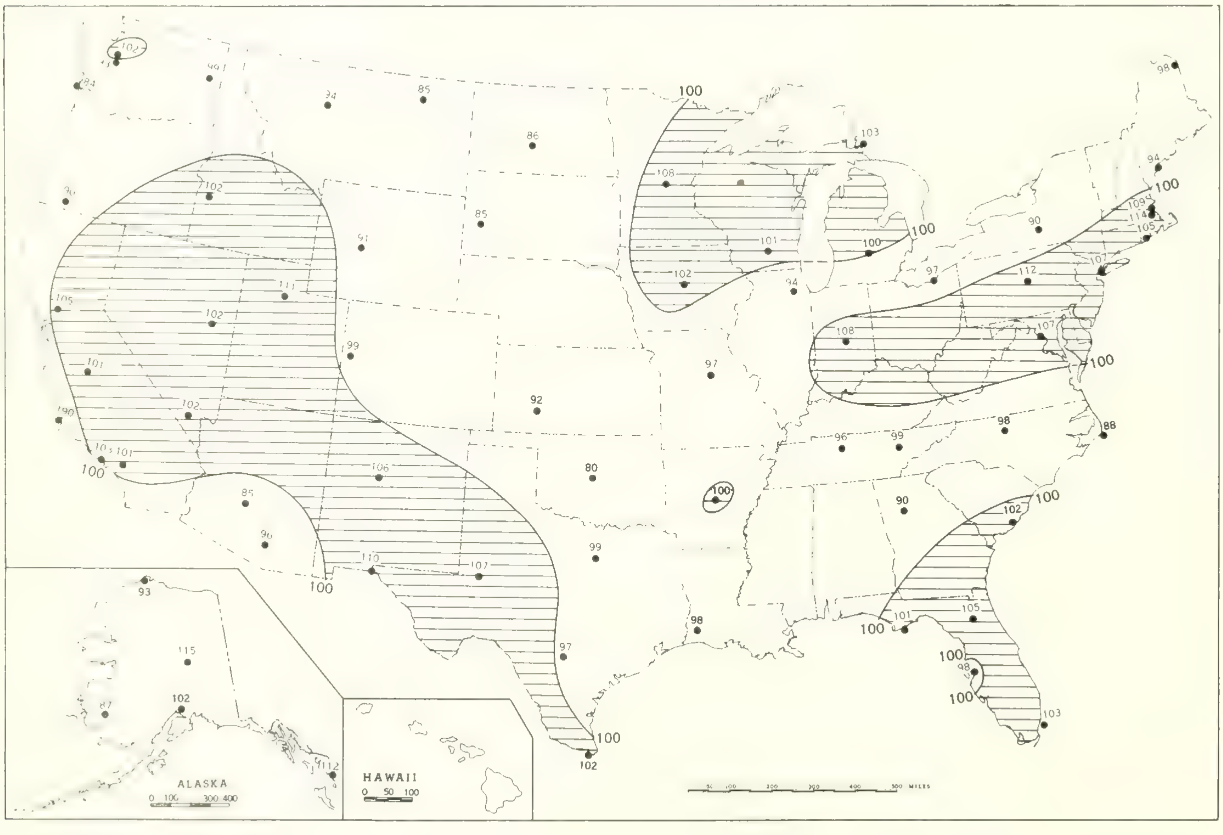


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, July 1966.

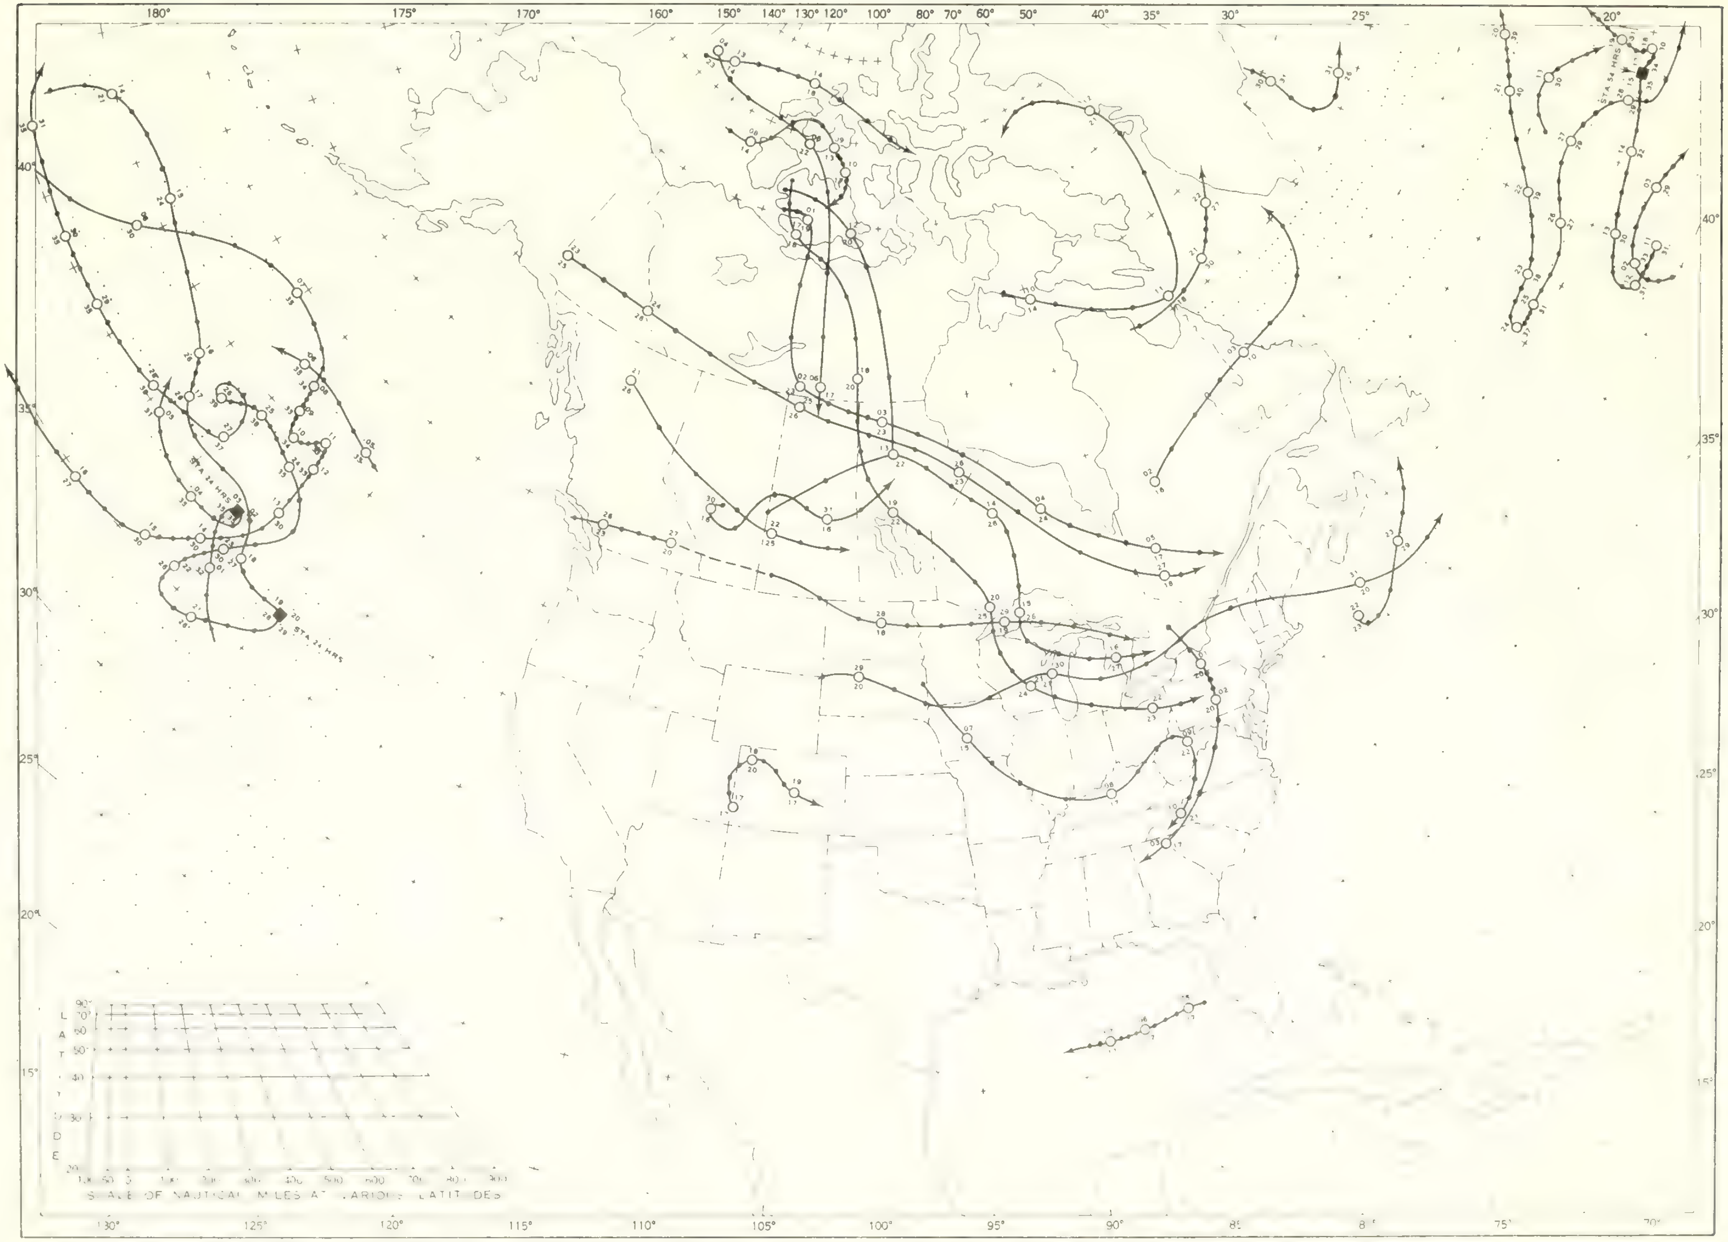


B. Percentage of Mean Daily Solar Radiation, July 1966.



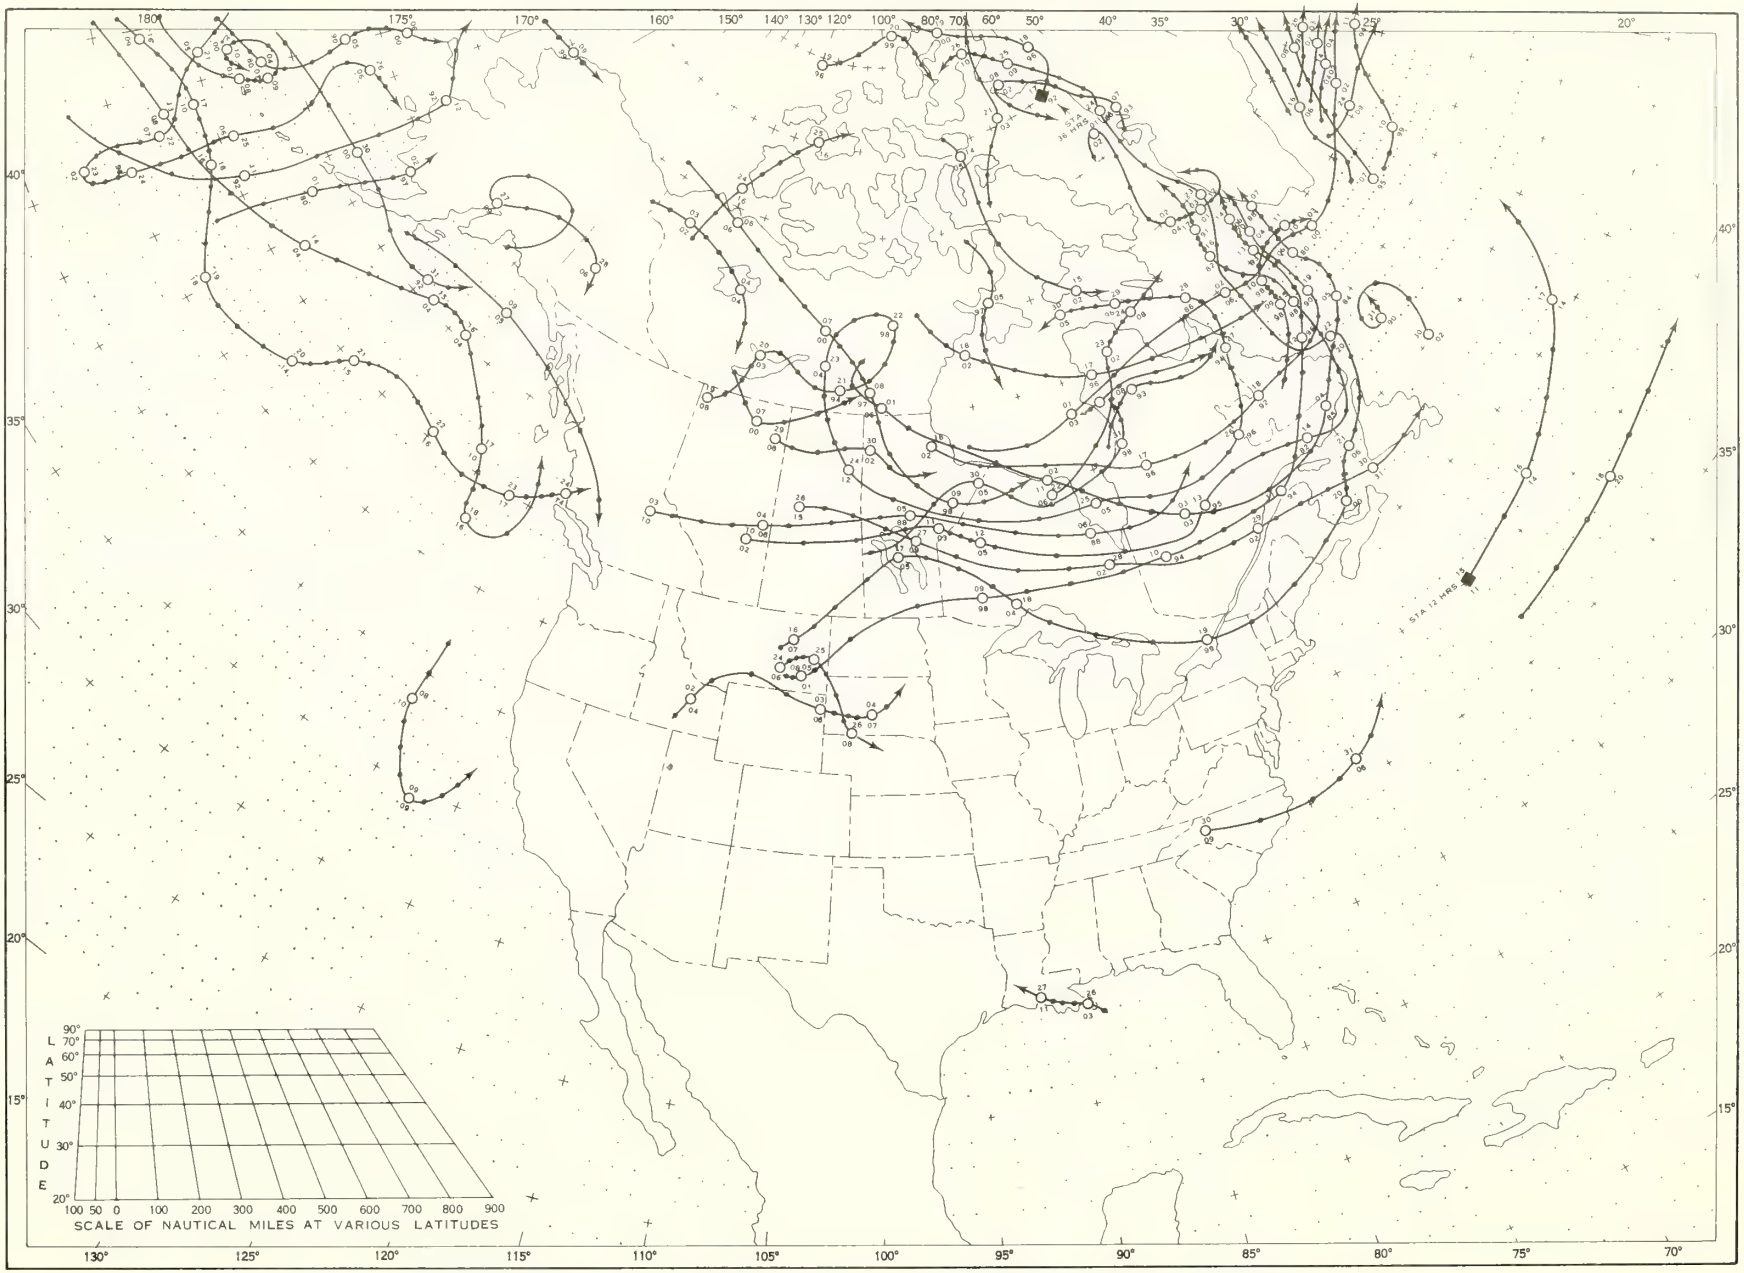
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, July 1966.



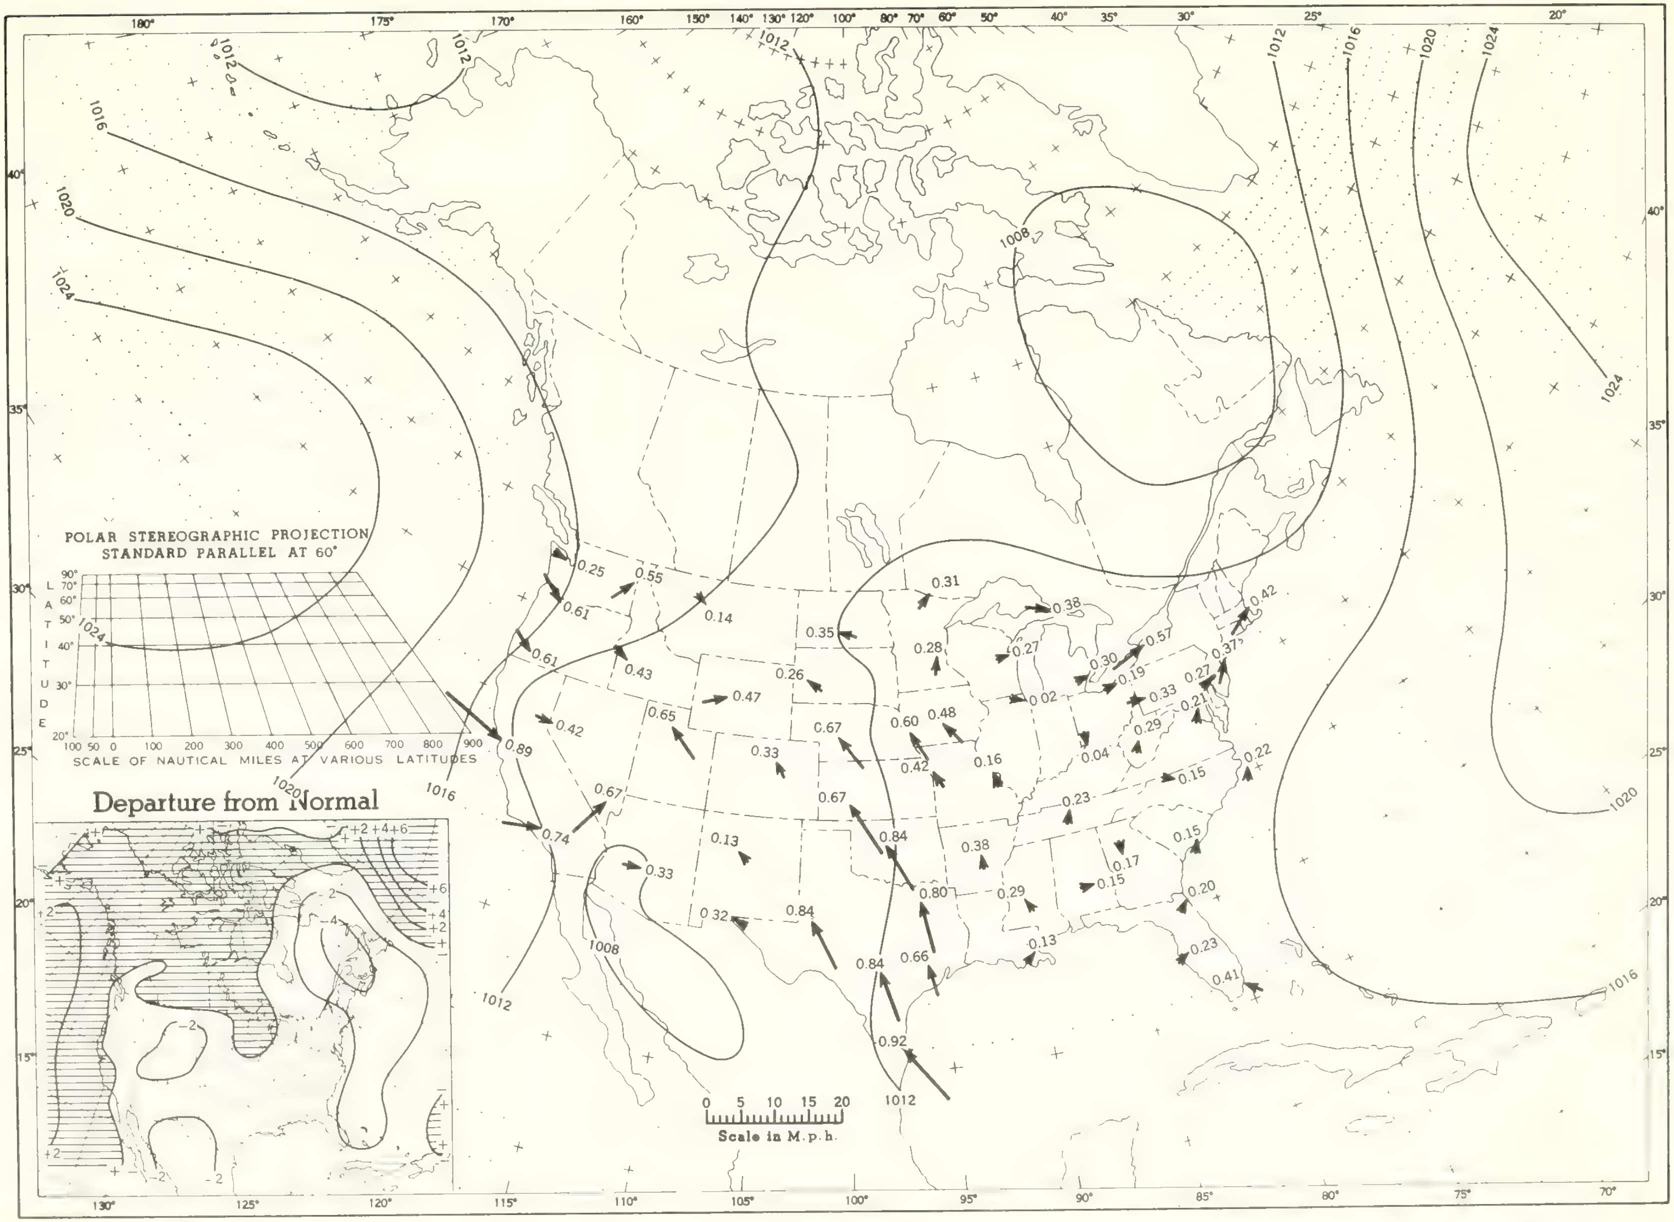
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, July 1966.



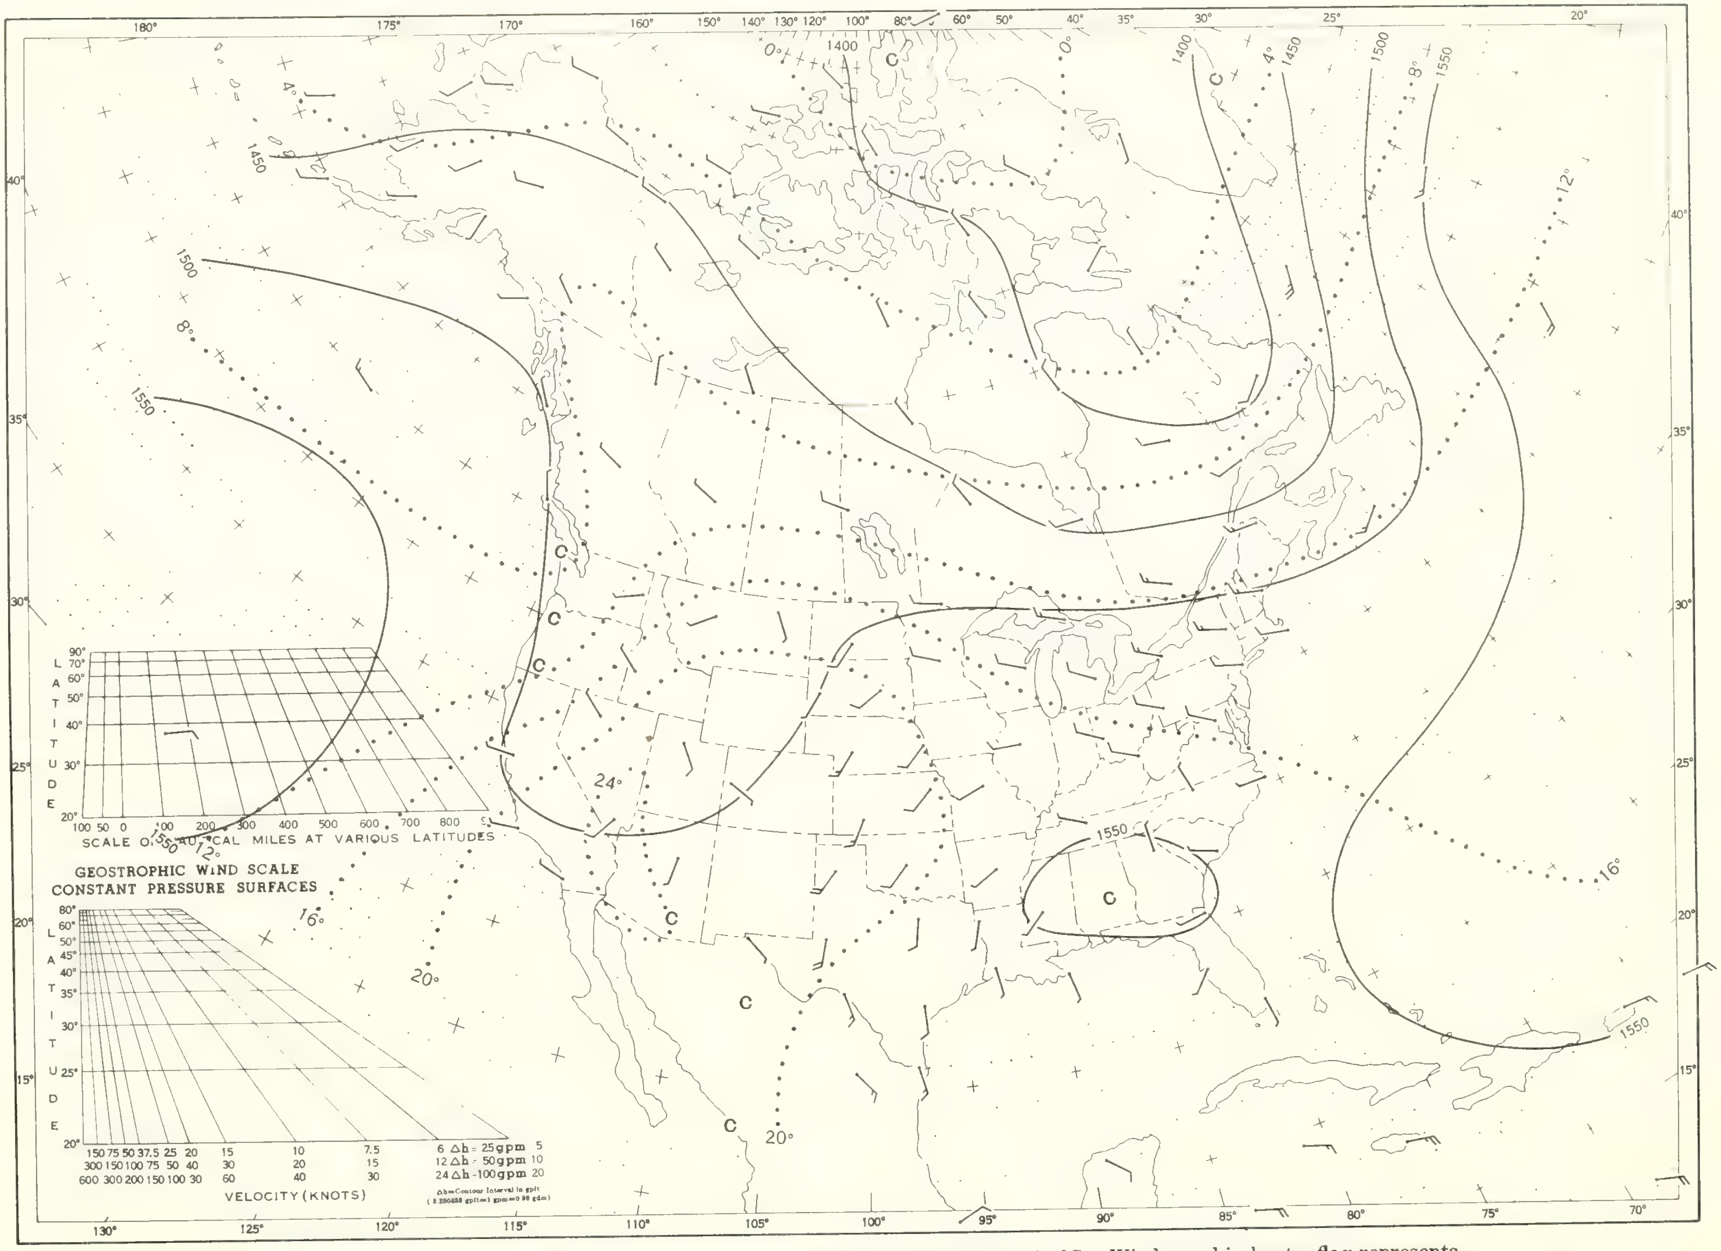
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, July 1966. Inset: Departure of Average Pressure (mb) from Normal, July 1966.



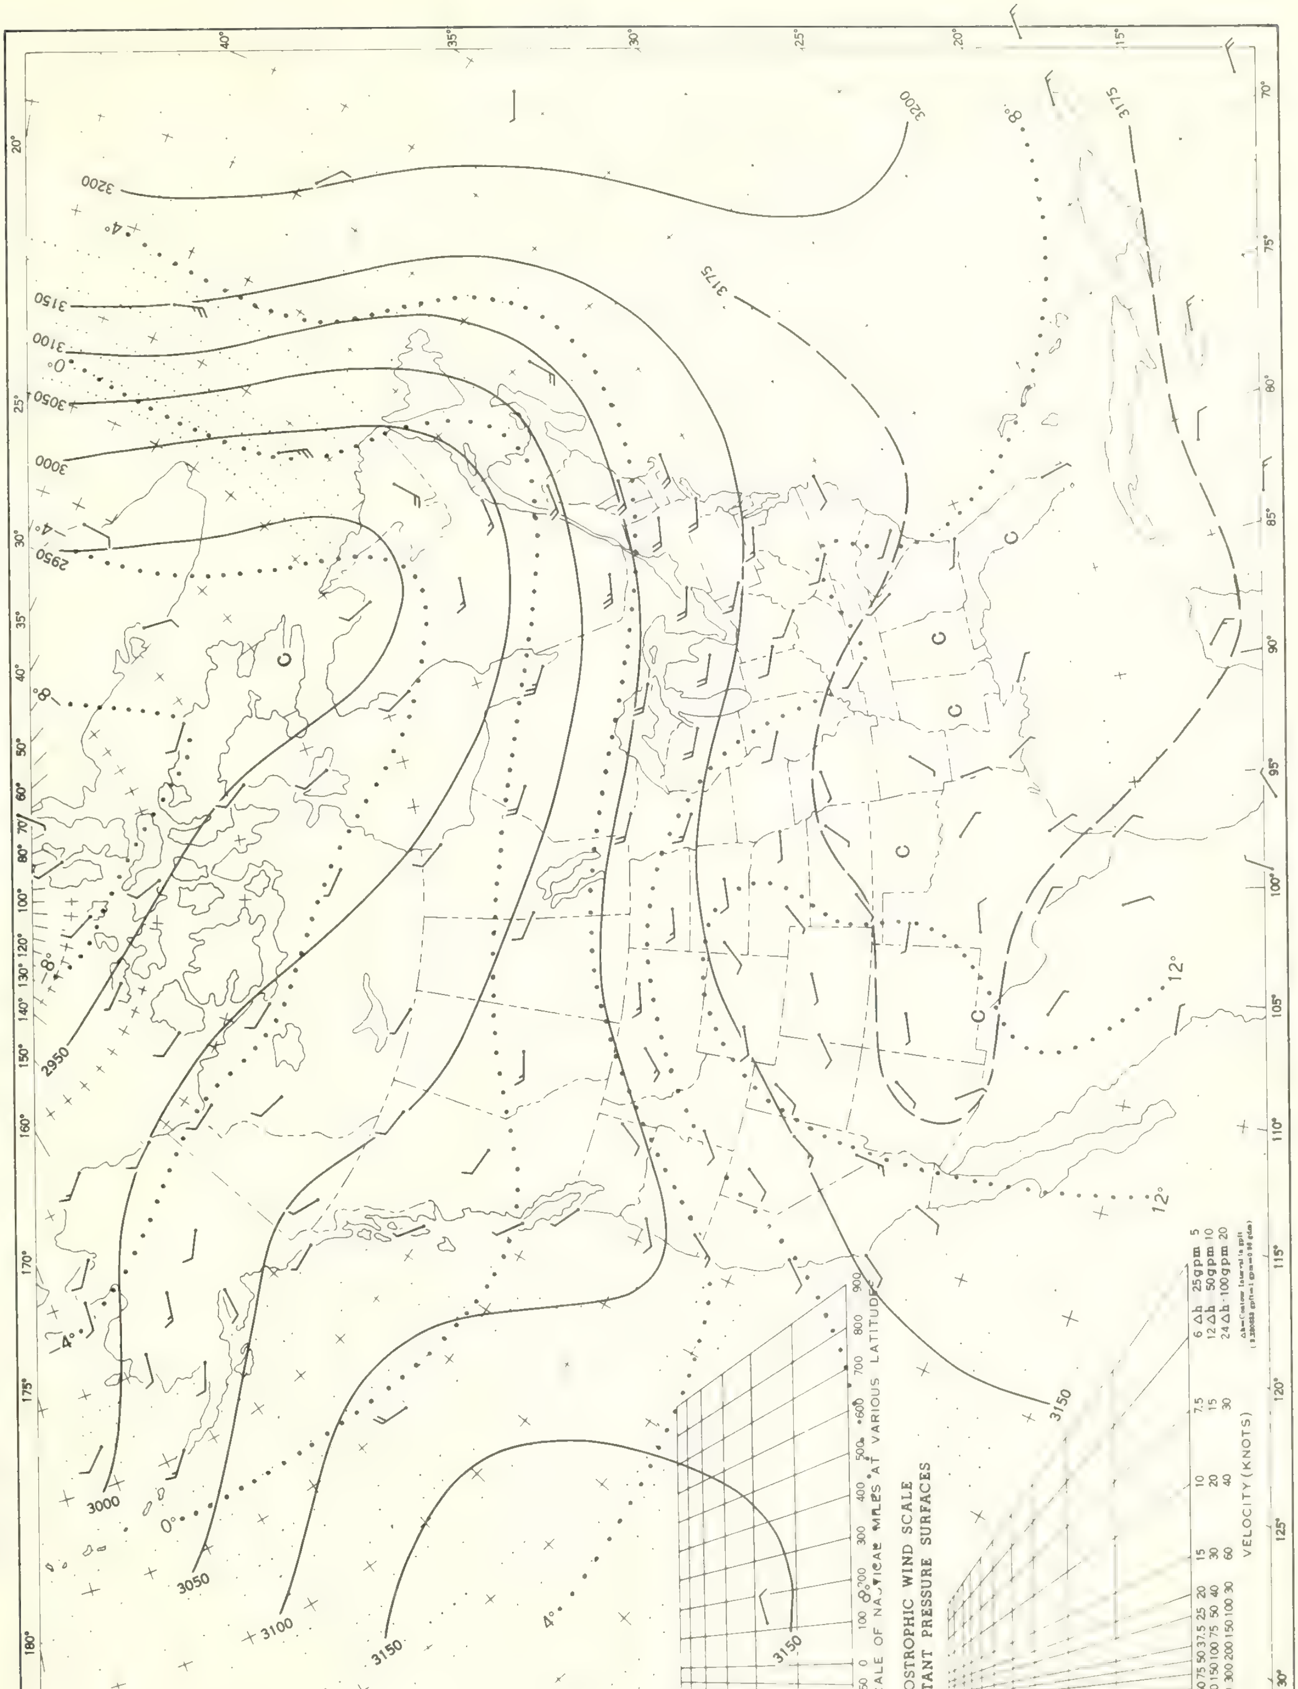
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed ÷ average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, July 1966. Average Height and Temperature, and Resultant Winds.



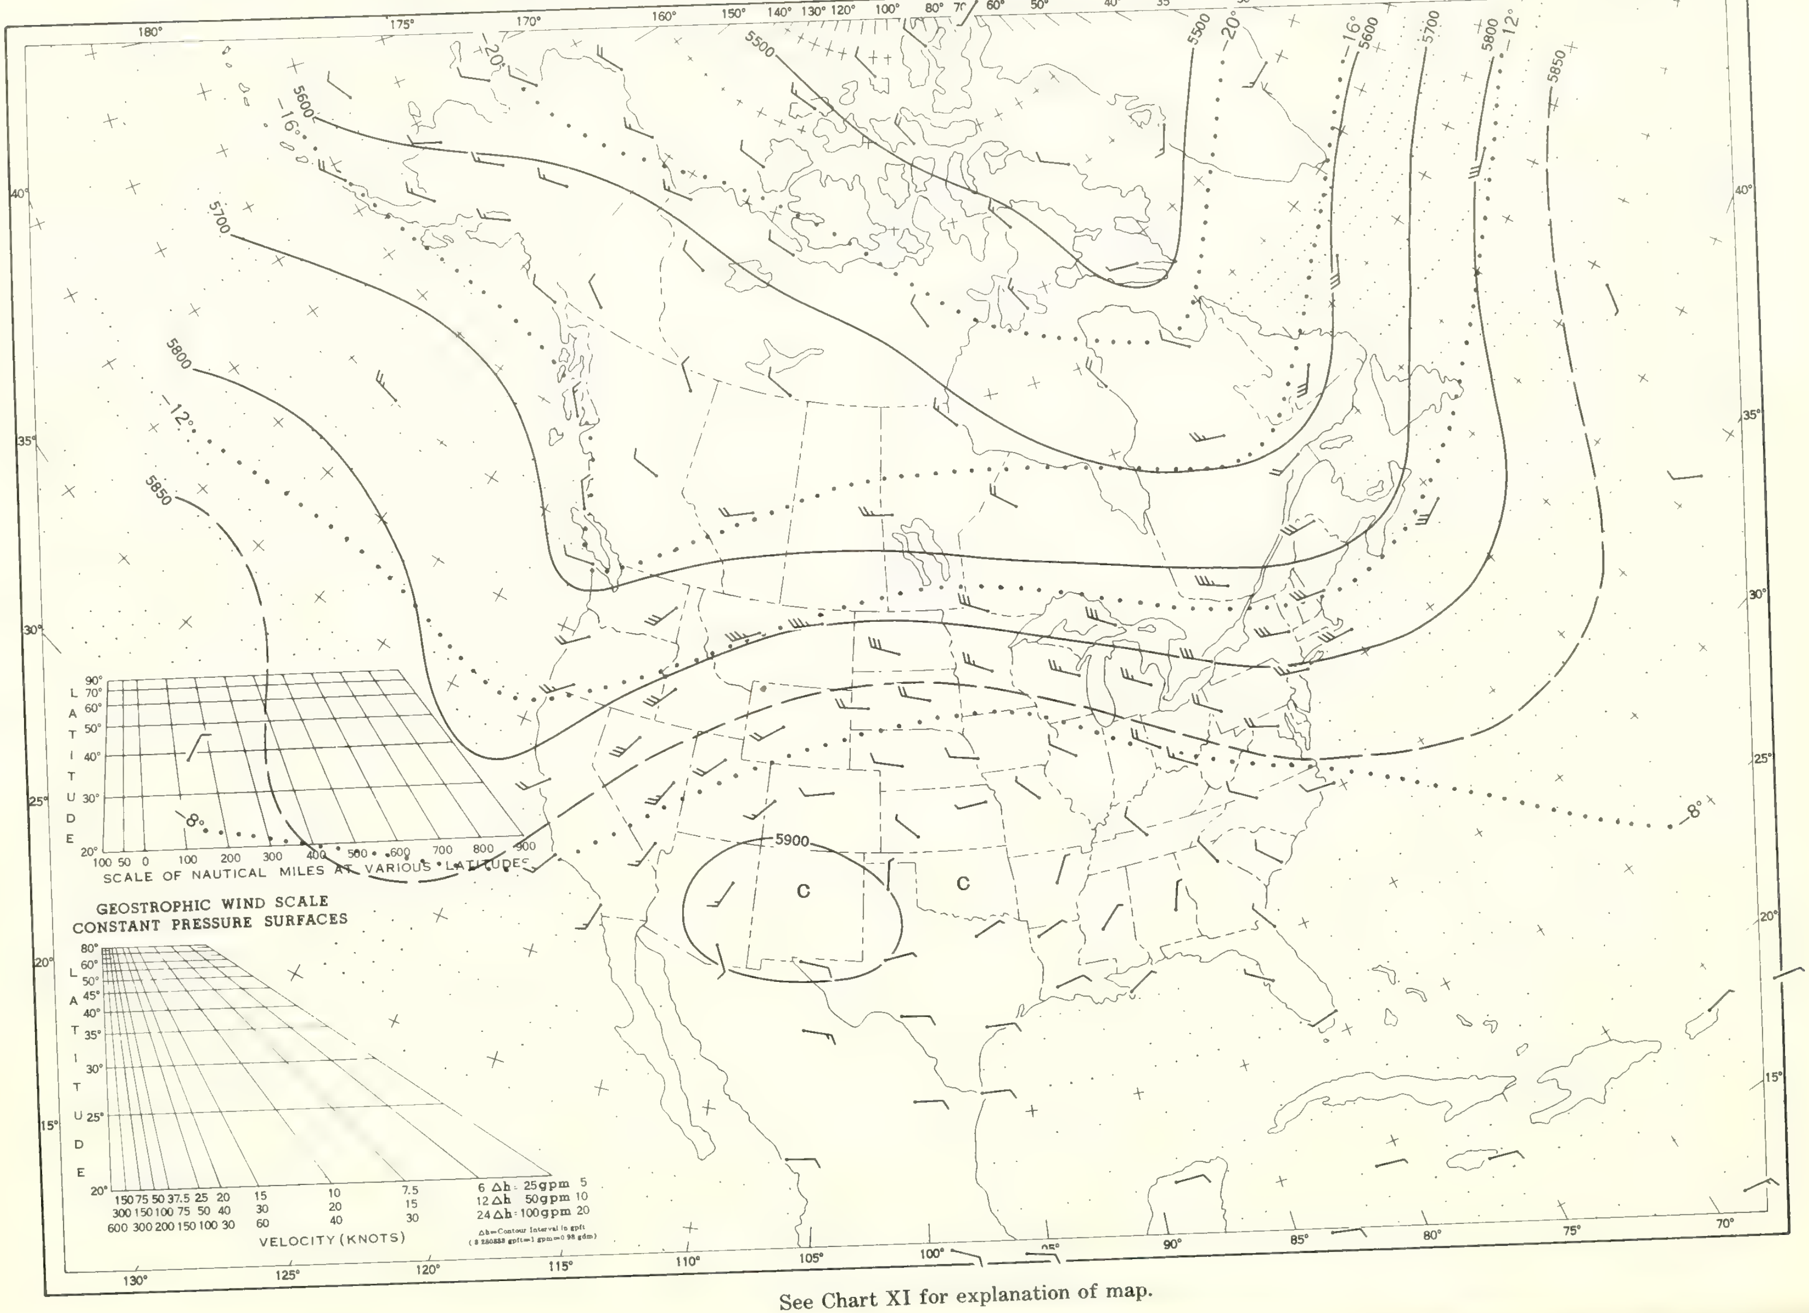
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, July 1966. Average Height and Temperature, and Resultant Winds.



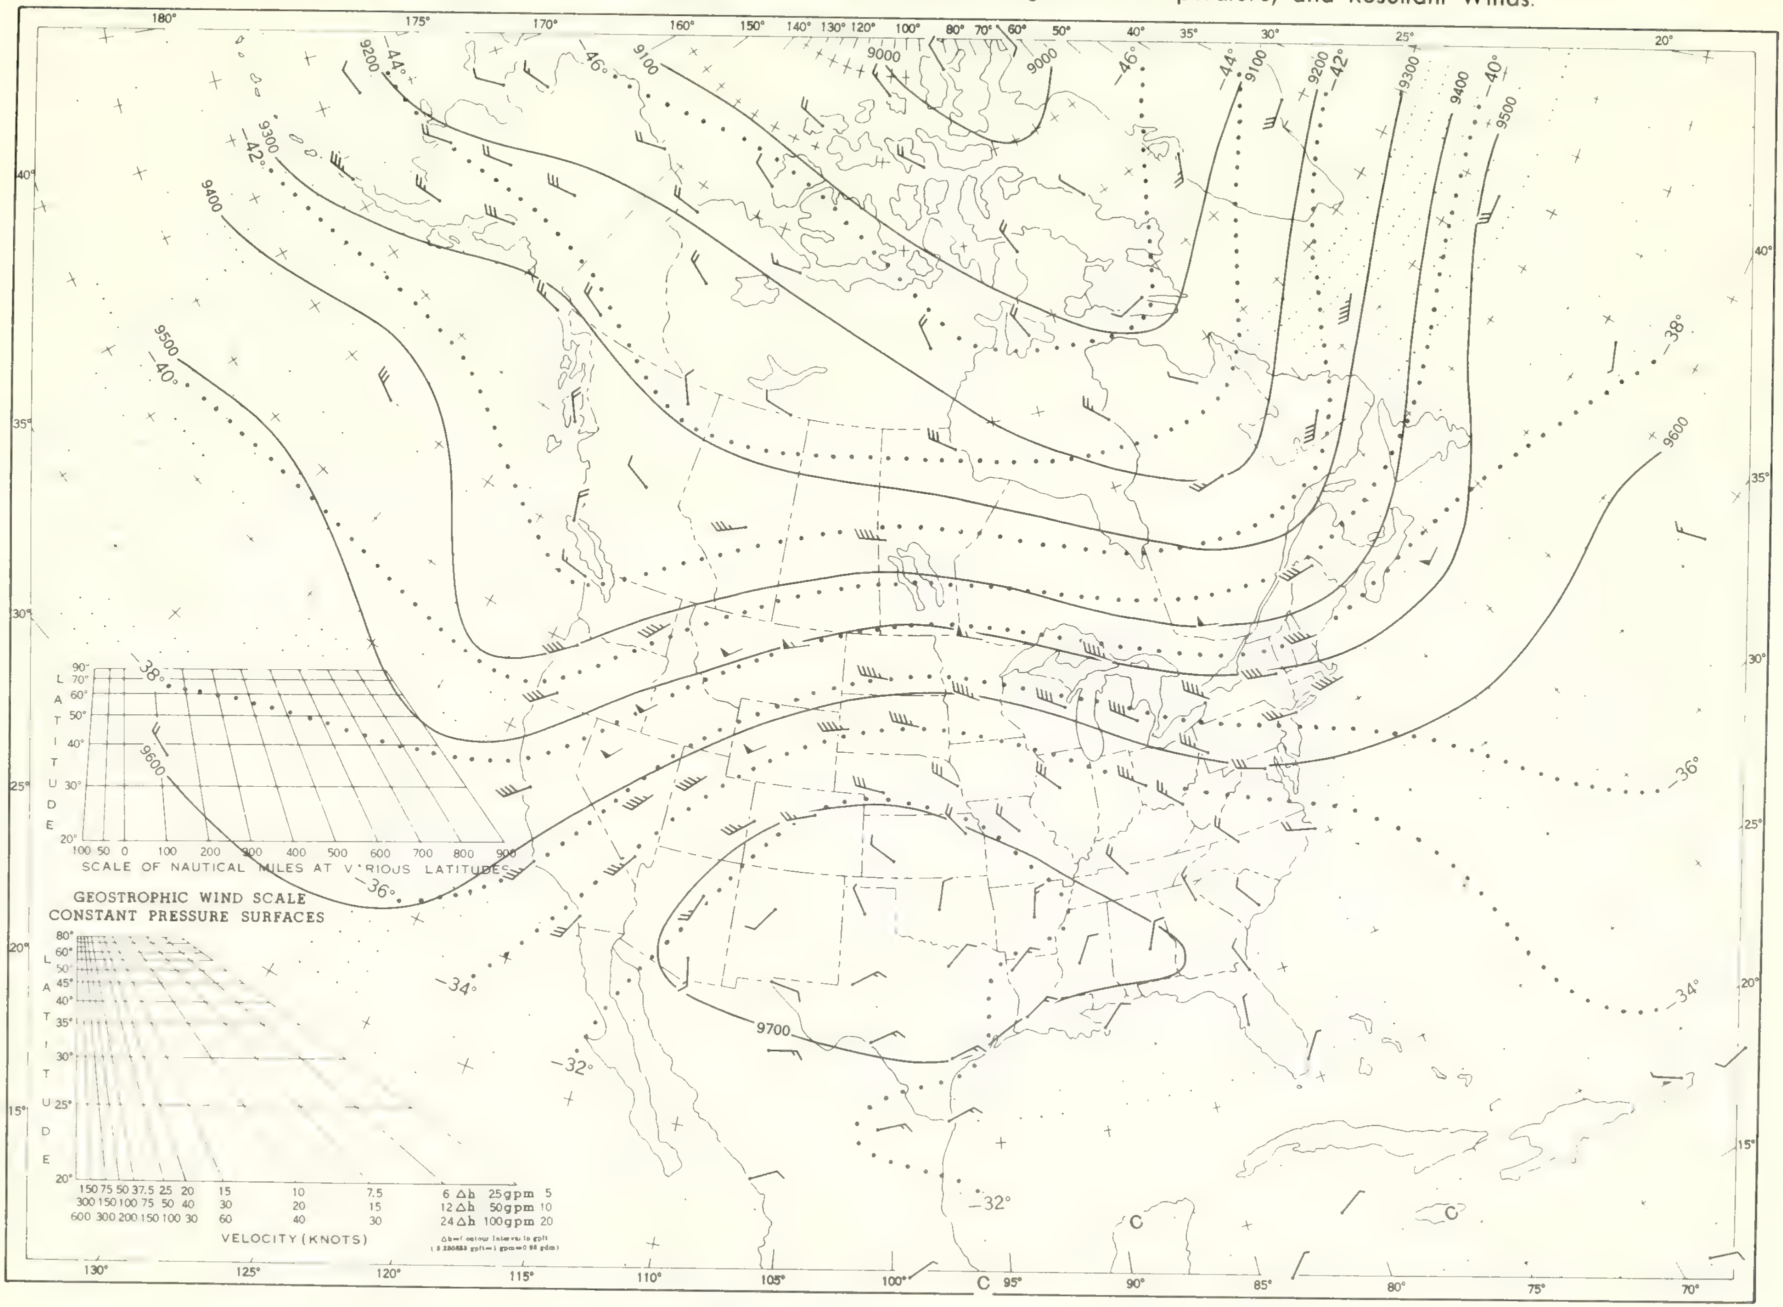
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, July 1966. Average Height and Temperature, and Resultant Winds.



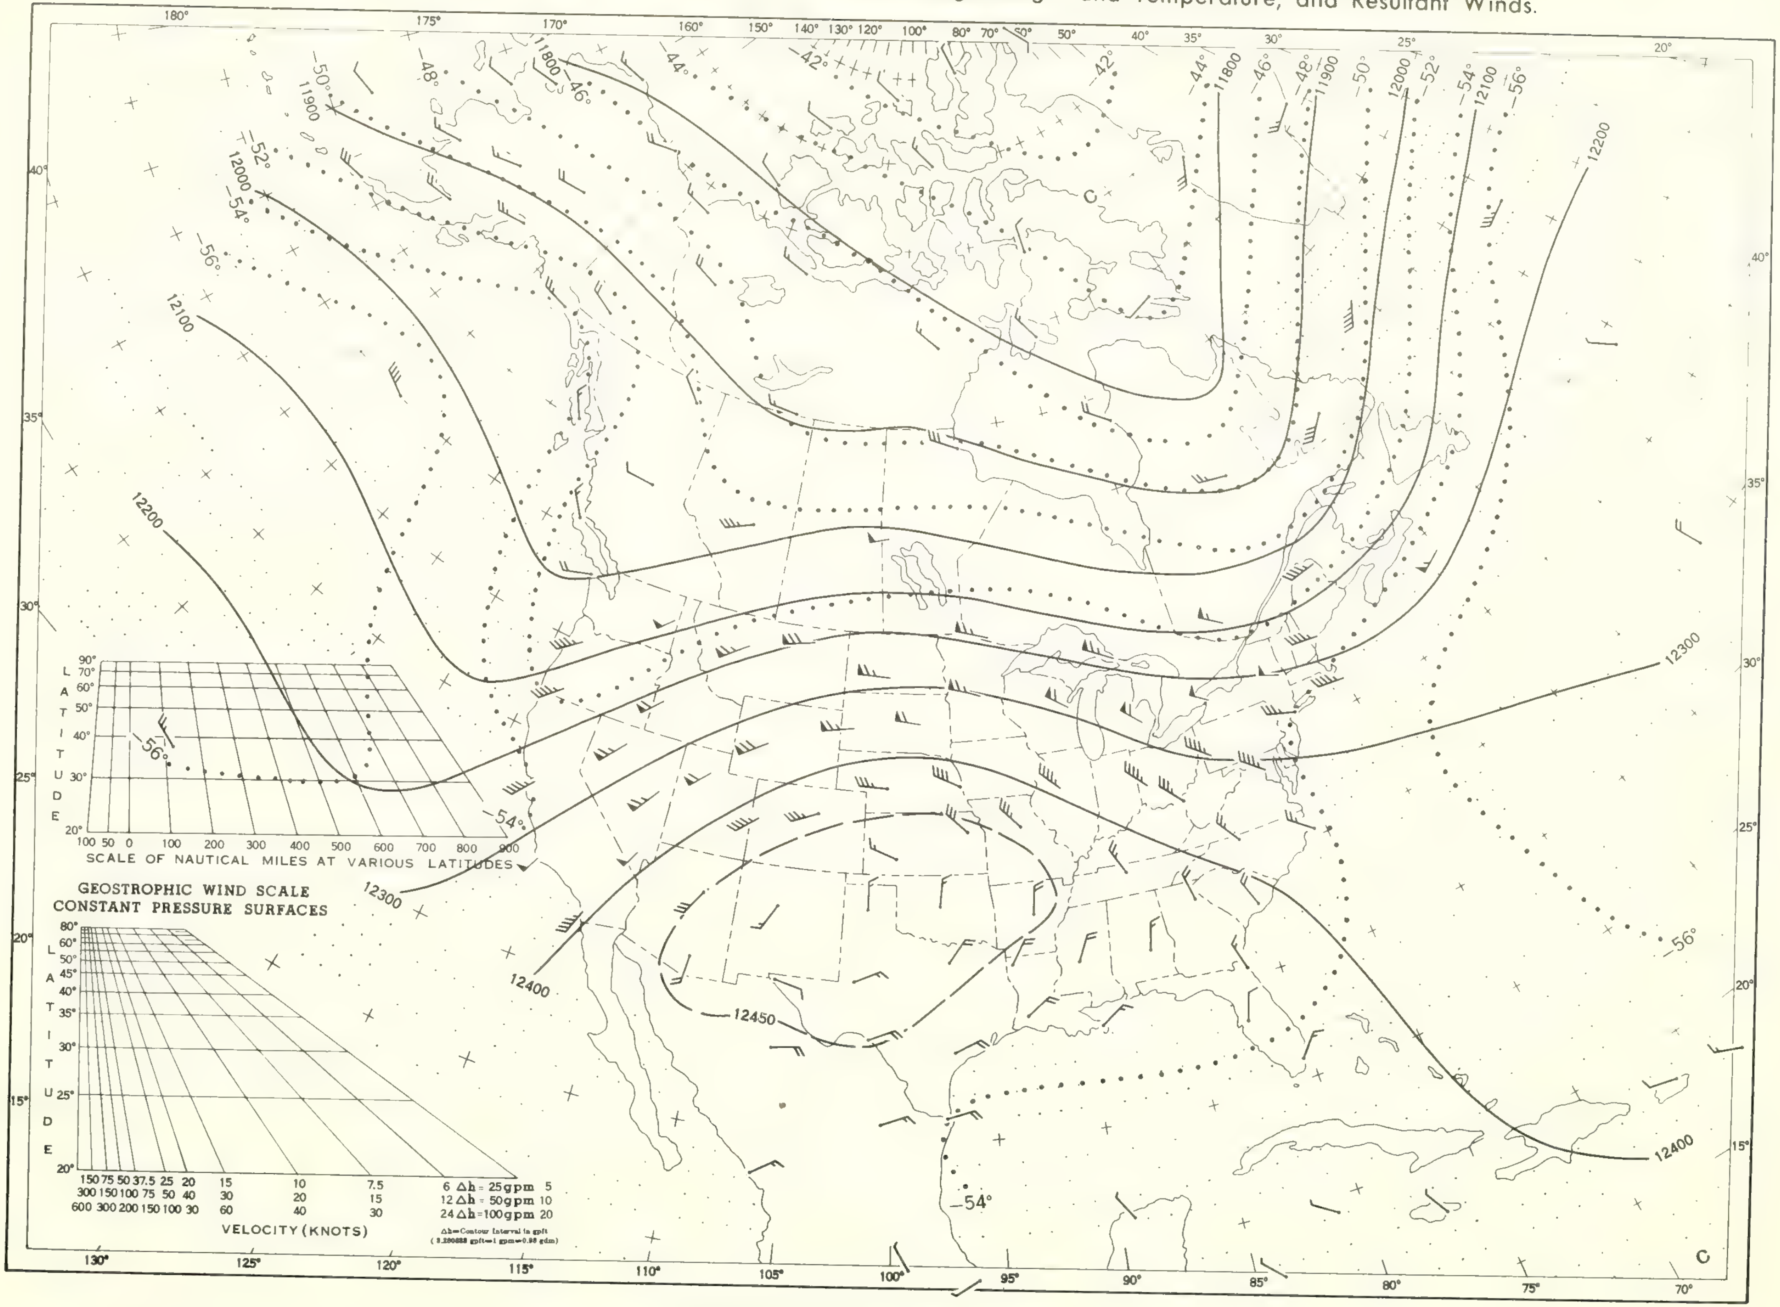
See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, July 1966. Average Height and Temperature, and Resultant Winds.



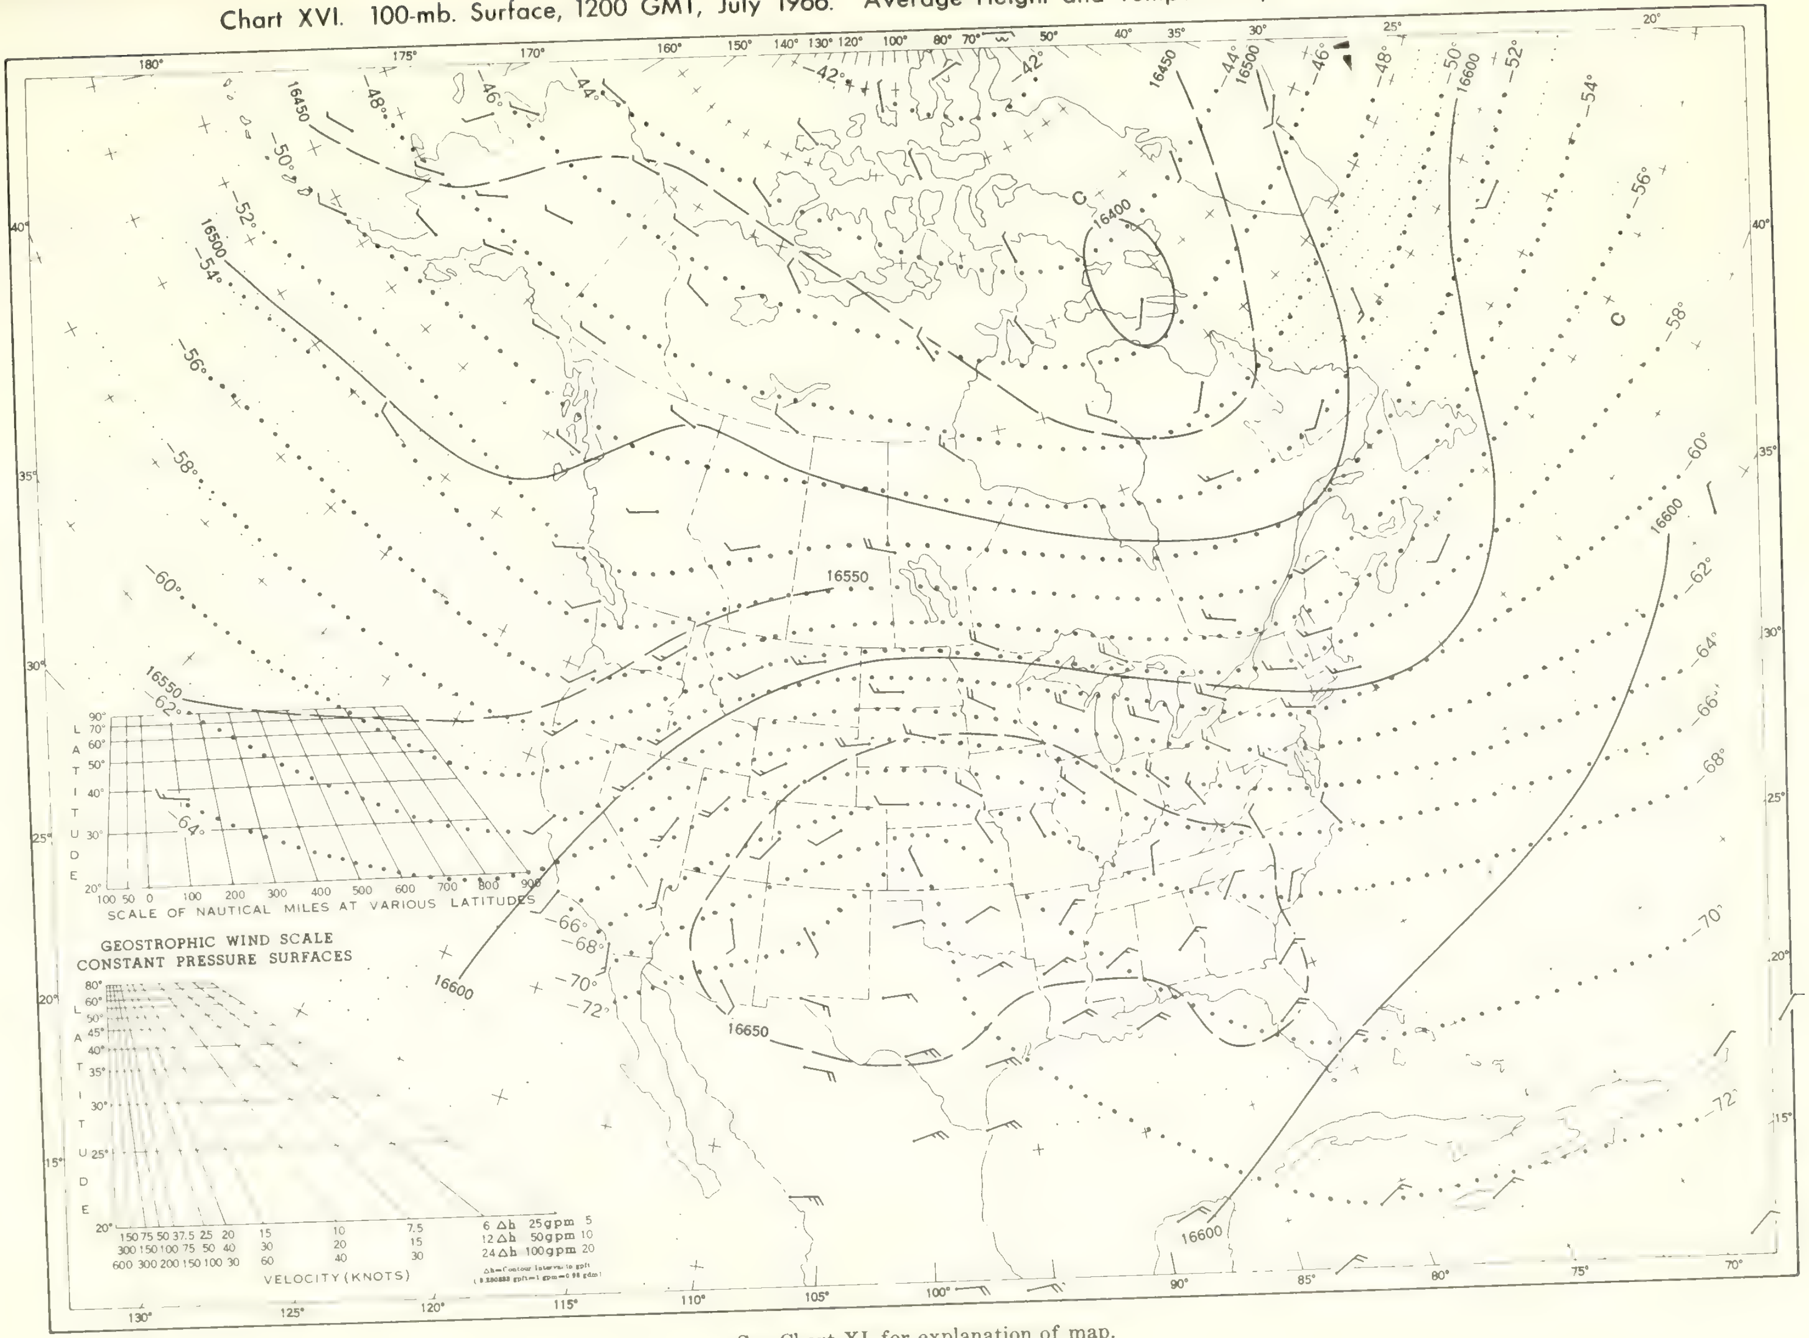
See Chart XI for explanation of map.

Chart XV. 200-mb. Surface, 1200 GMT, July 1966. Average Height and Temperature, and Resultant Winds.



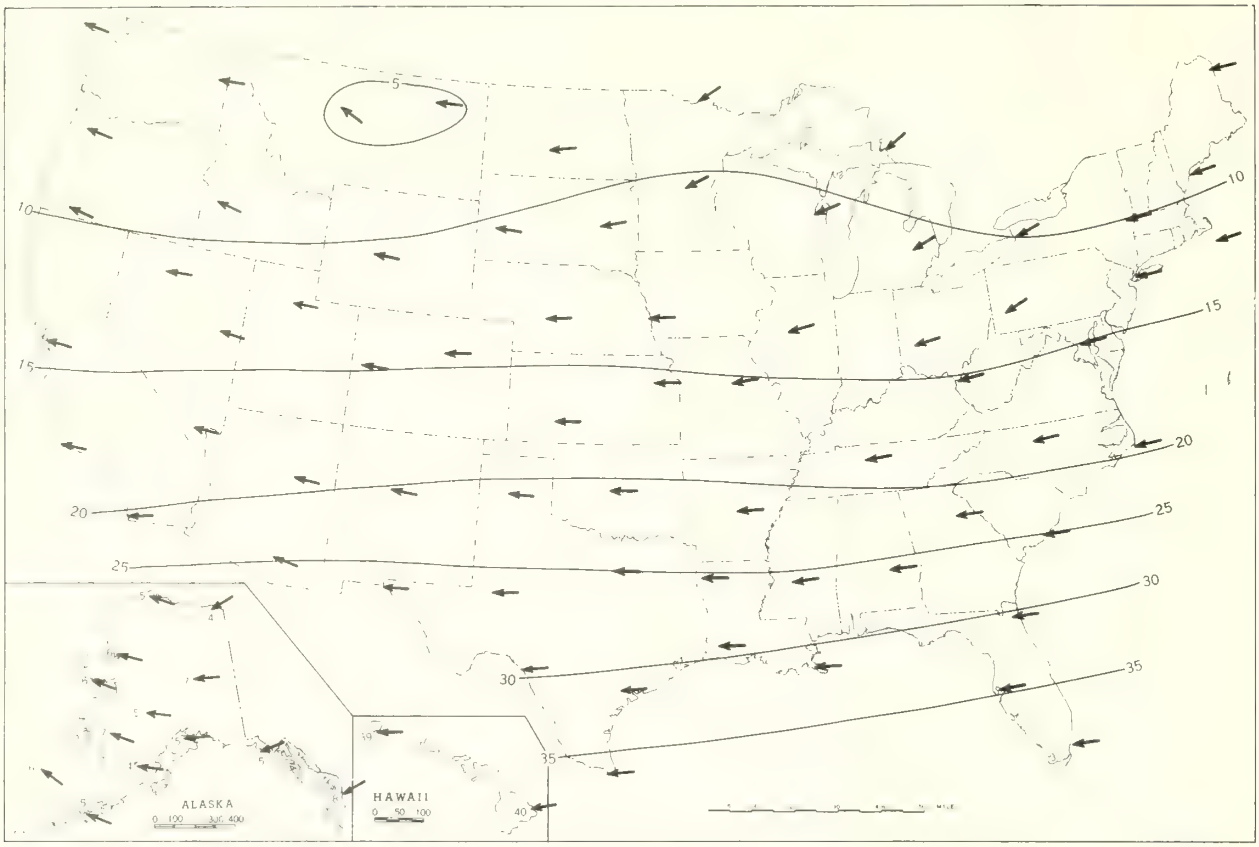
See Chart XI for explanation of map.

Chart XVI. 100-mb. Surface, 1200 GMT, July 1966. Average Height and Temperature, and Resultant Winds.

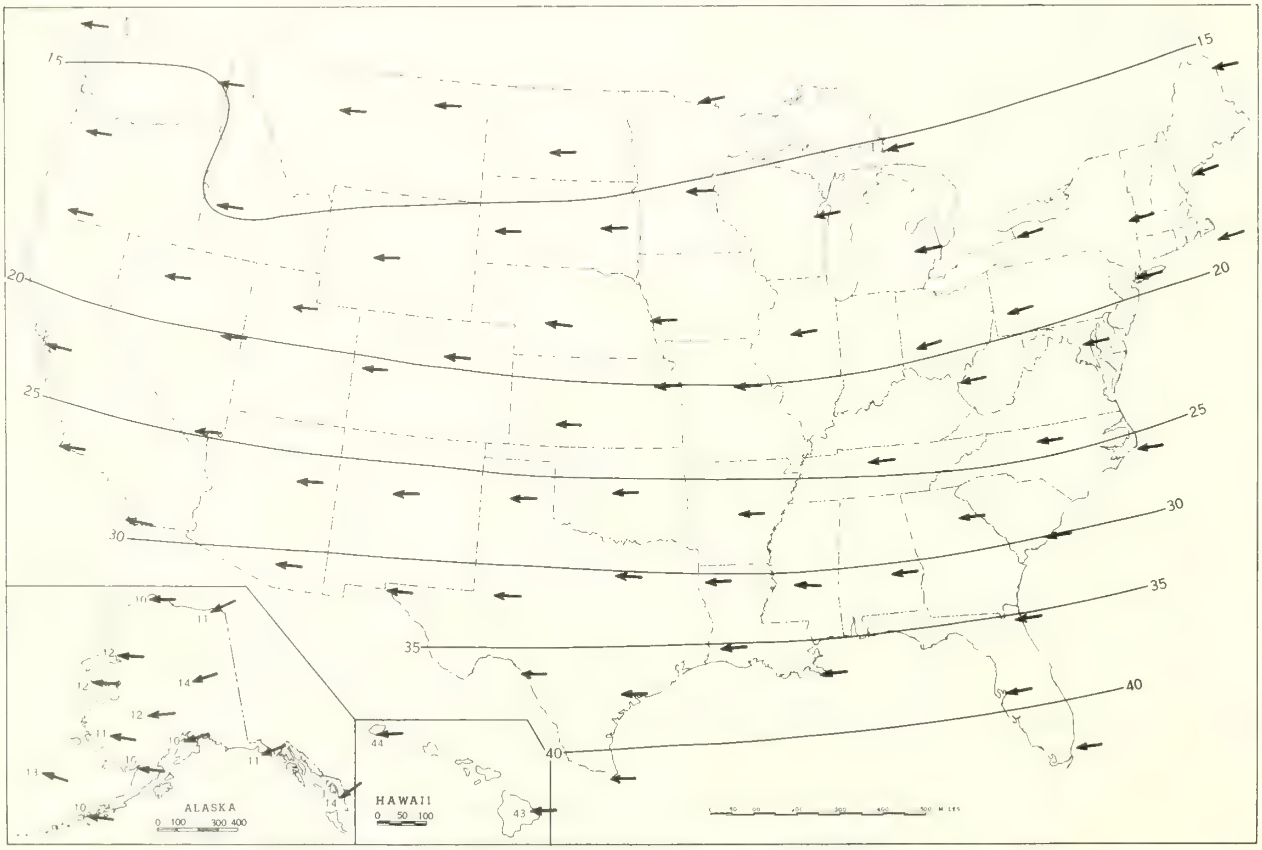


See Chart XI for explanation of map.

Chart XVII. A. 50-mb. Surface, 1200 GMT, July 1966. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, July 1966. Resultant Winds.



Wind speed (isotachs) in knots. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 8 AUGUST 1966

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Unusually cool and wet in Great Plains.

2. Severe drought persisting from Virginia to southern New England.

TEMPERATURE.--August was unusually cool from the Great Plains to the Appalachians, but warmer than normal in the Far West and Northeast. This temperature pattern was the reverse of the July pattern, but similar to that of August 1965. Temperatures were persistently below normal in the midcontinent area where frequent cold air masses from Canada dipped farther south than usual during August.

This was the coolest August since 1950 at Memphis, Tenn.; since 1927 at South Bend, Ind.; since 1911 at Bismarck, N. Dak.; and since 1906 at Amarillo, Tex. At the latter location temperatures averaged 25° below normal on the 23d and 16° below for the period August 21-27. Scattered frost damage was reported in the vicinity of Kalispell, Mont., on the last day of the month when a low of 31° was observed. The maximum temperature for the month at Huntington, W. Va., was 87°, the lowest maximum there for August during a record dating back to 1897.

Hot weather prevailed in the Northeast after the first week. High temperatures in the region were favored by southerly winds and abundant sunshine. Harrisburg, Pa., had its hottest August during a record dating back to 1888, the average temperature for the month, 78.3°, exceeding the previous highest average in 1900 by 0.1°. Temperatures rose to 90° or higher on 19 days at Washington, D. C., a new August record there. Boston, Mass., had its hottest August since 1961.

This August was one of the hottest at Sacramento, Calif., since 1877, and 12 days with 100° or higher set a new record. Phoenix, Ariz., had its hottest August since 1962.

PRECIPITATION.--August rainfall generally was above normal between the Continental Divide and the Appalachians, most of Florida, parts of New England, northern Idaho, southeast Oregon, and northwestern California. Marked deficiencies occurred east of the Appalachians from New York and southern New England to central Georgia, in western Indiana, Illinois, southeastern Iowa, northeastern Missouri, and most sections of the Pacific States and Great Basin of the Far West. At the end of the month streamflow was greater than usual in North Dakota, northern Minnesota, the southeastern half of Texas, central Ohio, and most of Kentucky, reflecting the abundant rainfall in those areas for the entire summer as well as for August. Pastures and ranges were very poor in the Northeastern Drought area, southern Illinois, southeastern Montana, and central and northern portions of the Great Basin of the Far West.

Rainfall ranged up to 500 percent of normal in the southern Great Plains with a high monthly total of 17.71 inches at Port Arthur, Tex., and up to 300 percent in northern portions where Greeley, Nebr., measured 12.62 inches for the highest total. During the second week torrential rains in parts of the Great Plains ranged up to a foot or more in Nebraska and Texas and resulted in serious flooding.

Heavy rainfall fell in a 6-county area of Nebraska on the 12th, with an unofficial measurement of 17 inches in Boone County. These rains resulted in serious flooding which caused property losses in the millions of dollars. Fullerton, where almost complete evacuation was necessary, apparently was hardest hit.

On the 11th heavy rainfall, measuring up to 10 inches, caused considerable flooding in the coastal areas of southeast Texas between Houston and the Louisiana border. On the 12th and 13th heavy rains in southwest Texas caused some smaller streams to rise to their highest levels in history and resulted in severe flooding along the Nueces and Frio Rivers.

Heavy rains fell in southeastern New Mexico and again in western Texas during the fourth week. Flood damage in the latter area was estimated at more than $4 million, and losses in the vicinity of Carlsbad, N. Mex., probably exceeded $1 million.

The greatest monthly total was 18.97 inches at Amity, Ark. Other high totals included 16.61 inches at Phelps Deerskin Dam, Wis., 15.70 inches at Grand Chenier, La. Record amounts included 14.46 inches at Little Rock, Ark.; the most for August back to 1879; 6.71 inches at Valentine, Nebr., an August record back to 1889; and 8.55 inches at Lubbock, Tex., an August record back to 1911.

The light rainfall in the Northeast continued the meteorological drought in that region. New York City water reservoirs were near normal levels, but farther south the flow of the Potomac River, water supply source for Washington, D. C., was near its lowest level on record.

In the Far West large areas not only had an extremely dry August but had received less than 50 percent for the year to date. This long dry period resulted in poor range conditions and a high fire hazzard; 15,000 acres of range and forest lands were burned in the Garden Valley district of Idaho early in the month.

Crop prospects were dimmed somewhat in the Northeast Drought area, and also in parts of Indiana, Illinois, and Missouri.

DESTRUCTIVE STORMS.--During the second week thunderstorms occurred over a wide area east of the Rockies, some of which were accompanied by damaging winds. On the 11th a speed of 156 m.p.h. was recorded at Linden, N. J., during one of these thunderstorms. On the 16th a thundersquall caused $140,000 loss at Canastota Airport in New York.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

°	Includes crop damage
C	Crop damage
R	Rain
L	Local flooding
W	Including a waterspout

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
∅ For breakdown of "All Others", and for detailed listing of other storms, see the U. S. Weather Bureau monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5,000,000
7	$5,000,000 to $50,000,000
8	$50,000,000 to $500,000,000
9	$500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

AUGUST 1966

Elmer R. Nelson, Office of Hydrology

Record to near record flooding occurred on streams in east-central Nebraska during August. Preliminary estimates of damage were placed at over $2.2 million. There was no loss of life. Major flooding occurred in Southeastern New Mexico in Pecos Basin. Hundreds of persons were evacuated. Three counties were declared disaster areas. At least two lives were lost due to drowning. Considerable damage resulted to crops from the flooding in the White Basin. High intensity rains caused severe flash flooding in the Frio River Basin in Texas. Five thousand persons, mostly campers were evacuated. Flooding reported elsewhere in the 48-Contiguous States was mostly light.

ATLANTIC SLOPE DRAINAGE

Very light overflow occurred along the Lumber River at Lumberton, N. C., during the latter part of August. The stream began rising slowly on the 22d, reaching flood stage on the 27th and crested 0.4 foot above bankfull stage on the 28-29th. Minor flooding occurred along the North Fork Edisto at Orangeburg, S. C., on the 4-6th. Along the main stem at Givhans, S. C., there was minor overflow from the 9th to the 11th. No damage resulted from the minor overflows. The heavy intense rain (10.35 inches) at Branchville, S. C., on the 4-5th caused local flash flooding of ditches, small tributaries, and low poorly drained areas. High water and strong currents prevented the use of the stream most of the month.

The Haw River at Haw River, N. C., reached a new low stage of 1.5 feet on the last day of the month. The previous low stage was 1.6 feet in 1963. The Roanoke River at Randolph, Va., reached, but did not exceed, the record low water stage of 3.7 feet set in 1944, on August 30.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Heavy rains (5 inches) during the early morning hours of the 21st caused a 2-foot overflow on the Black Hawk Creek at Hudson, Iowa. Excellent reporting allowed ample time for forecasting flood conditions. No damage resulted from the high water.

Missouri Basin.--East Central Nebraska Floods: Thunderstorms developed in east-central Nebraska during mid-morning of the 12th. Heavy rains followed in the afternoon between 2 and 5 over the middle and lower reaches of the Cedar River and in the lower reaches of the Loup River basin. Another period of heavy rains occurred generally from 6 p.m. to 11 p.m. over the lower reaches of the basin. The heaviest rains, with amounts as high as 16 inches, occurred in Boone and Greely Counties.

Record flooding occurred on the Cedar River at Fullerton, Nebr., on the 13th with a crest of 14.9 feet. The previous highest stage at Fullerton was 9.6 feet on July 19, 1950. Upstream at Spaulding, Nebr., the Cedar reached a near record stage of 6.9 feet. It approached within 0.6 foot of the 7.5-foot record stage set on June 23, 1947. Several communities reported severe damage. Water stood 17 feet deep in low places in Fullerton, Nebr. Many people were stranded in tree tops. The Union Pacific Railroad depot was completely inundated and wrecked by the high water. Livestock losses were enormous. Feedlots near the Cedar River were flooded and farmers reported their stock had perished.

The main stem of the Loup River, and most of its tributaries rose rapidly out of their banks. Record flooding occurred on the Loup River at Genoa, Nebr., on the 13th and at Columbus, Nebr., on the 14th. The crest of 13.5 feet at Genoa, Nebr., exceeded the previous maximum stage of 10.1 feet of June 23, 1947 by 3.4 feet. At Columbus, the crest of 13.0 feet exceeded the previous maximum stage of 12 feet by 1 foot. The crest reached Columbus about 2 a.m. on Sunday, inundating more than one-third of the city.

The Platte River at North Bend, Nebr., went out of its banks at North Bend, Nebr., early on the morning of the 14th. It crested in the early afternoon at a stage of 6.9 feet, 0.9 foot above flood stage. Farther downstream at South Bend, Nebr., the Platte reached a crest of 10.0 feet on the 15th.

The heaviest damage occurred along the Loup River at Columbus, Nebr. More than 600 homes were affected. The total damages in this area was estimated at $1.5 million. Heavy damages were also reported along the Cedar River at Fullerton, Spaulding and Cedar Rapids, Nebraska. The total damages in this basin exceeded $0.5 million. The total urban damages in the Central Nebraska flood of August 12-14 was estimated at over $2.2 million.

Other Floods.--Minor overflows were recorded on the North Fork of the Solomon River at Lenora, Kans., on the 13th and on Chapman Creek near Chapman, Kans., in the lower Smoky Hill River basin on the 21st. This flooding was due to locally heavy rainfall in the immediate drainage areas.

White Basin.--There were two periods of flooding on the Cache River in eastern Arkansas during August. The first was light and continued from July. It crested 0.5 foot above flood stage on the 2d. The second overflow was more serious and lasted from the 13th to the 29th, cresting 2 feet above flood stage on the 19th-21st. This caused considerable damage to crops planted along the flood plain. Nearly 6,000 acres were inundated in Woodruff and Monroe Counties with damages estimated near $0.5 million.

Arkansas Basin.--Over 8 inches of rain was reported in the vicinity of Buffalo, Okla., during the night of the 9th causing flooding in local creeks and partial destruction of several bridges. Heavy rainfall on the 11th in Haskell County, Okla., caused brief flooding on San Bois and Otter Creeks. Several bridges were damaged and two destroyed. Eight to 10 inches of rainfall on the 31st in about 2 hours produced moderate flooding on Deep Creek in Blaine and Major Counties.

Three inches of rain on the 18th in less than 1 hour, in the North Canadian Basin above Woodward, Okla., caused brief flash flooding on the outskirts of Woodward. Several homes were flooded. Some parked cars were also damaged. Telephone service was also interrupted. Some local flooding occurred in the headwaters of Wichita Basin from heavy showers on the 24th. Brief flooding occurred on Deep Red Creek and Dead Man's Creek, Horse Creek and Jack Creek from heavy showers (2.5 to 3.5 inches) on the 28th. Local brief flooding occurred on Cow Creek in the vicinity of Addington, Okla., on the 29th from heavy rains.

Heavy rain on the 12th and 13th caused local flooding in low places in Little Rock and considerable flooding in North Little Rock where evacuation by boat was necessary.

Red Basin.--Heavy rain (8 to 10 inches) on the 21st caused severe flooding along the Caddo River from Amity-Bismarck, Ark., area to DeGray Dam. A major loss was averted when the runoff water from the Caddo River stopped rising just 0.7 foot from the top of the newly constructed DeGray Dam. The pool behind the earthen dam rose 70 feet. Light to moderate flooding occurred along the lower reaches of the Ouachita River. Minor flooding occurred along the Saline River at Benton, Ark., on the 22d and 23d. Approximately 3,000 acres were inundated along the Caddo River in Hot Spring County and 10,000 acres along the Ouachita River in Dallas, Clark, and Ouachita Counties. The total damages were estimated at over $50,000.

Lower Mississippi Basin.--The Mississippi River at Memphis, Tenn., reached a record low stage of -0.3 foot on August 1. Above normal rainfall during August produced minor fluctuations in stage between zero and 3 feet.

WEST GULF OF MEXICO DRAINAGE

Minor flooding occurred along the Salt Fork of the Brazos River near Aspermont, Tex., on the 30th. This was due to heavy rain on the 29th. Minor flooding occurred along the Navasota River near Easterly, Tex., on the 16th and near Bryan, Tex., on the 20th-21st.

Rain damage was extensive in the Beaumont-Port Arthur, Tex., area on the 11th. The Jefferson County Civil Defense Council requested the Governor to declare Jefferson County a disaster area with storm damage estimated near $1.5 million. The Jefferson County Airport recorded a maximum of 6.39 inches in 3 hours; 4.36 inches in 1 hour; 3.05 inches in 30 minutes; 1.75 inches in 15 minutes; and 0.66 inch in 5 minutes.

Very high intensity rains, up to 16 inches, occurred during the early morning of the 13th on the West Nueces, the extreme upper Nueces, the Dry Frio, and the extreme upper Frio in Texas. Flash flooding forced evacuation of about 5,000 persons, mostly campers, along the Frio and the Dry Frio Rivers. At Cocan, Tex., the Frio River reached a stage of 23.7 feet, the highest stage since 1936. This was well below the record height of 34 feet reached in 1932. The Dry Frio at Regan Wells, Tex., reached a stage of 28.3 feet, the highest stage since the record height of 33 feet in 1880. Flash flooding also occurred on the West Nueces and the extreme upper Nueces. Considerable flooding occurred on the Frio River between the 15th and 22d. The flood waters added about 1 foot to the level of Lake Corpus Christi, raising it to a stage of 86.5 feet.

Most of the flood damage occurred along the Frio and Dry Frio Rivers in Uvalde and extreme southern Real Counties. Damage occurred also on the West Neuces in Edwards and Kinney Counties and along the upper Nueces and tributary creeks in Edwards, Real, Uvalde, and Zavala Counties. Resort areas were inundated by flash flooding at Garner Park and near Cocan, Tex., with facilities damaged and camper's equipment lost or damaged, including some cars flooded. Numerous ranch houses and other buildings were flooded. Fences, pens, and earthen dams were washed out. Some livestock were drowned or strayed away. Considerable wild life was lost, mostly deer. The total damages were estimated near $700,000.

The Highway Department staff at Leakey, Tex., on learning of the heavy rains in the headwater area of the Frio and Dry Frio Rivers from the Weather Bureau went through the camping areas warning campers of the impending flash flood. As a result, nearly all the campers were evacuated before the flooding began. Only a few campers were trapped by the flood waters. There was no loss of life.

Southeastern New Mexico Floods.--Heavy rains (up to 10 inches) on the 21st to the 23d caused major flooding in the Pecos River Basin in southeastern New Mexico on the 23d and 24th. A rather long period of almost daily showers preceded this storm setting the stage for heavy runoff. These showers were the heaviest in the upper reaches of the arroyo and stream system on the east slope of the Sacramentos. On the 23d, the heavy rains shifted slowly eastward from the high elevations, adding more water to the flood waters downstream. The streamflow at Carlsbad, N. Mex., reached 80,000 to 100,000 c.f.s. on the 23d.

This was a major flood in the Pecos Basin and approached the severity of the flood of October 2, 1904. During this historic flood, the Avalon Dam, 5 miles upstream from Carlsbad failed.

Property damage was heavy, especially in rural areas along Dark Canyon. At Artesia, N. Mex., many families were evacuated from their homes. Two bridges were washed out on U. S. Highway 285 between Artesia and Carlsbad. Another bridge on U. S. Highway 180 between Carlsbad and El Paso, Tex., was washed away. Two people were rescued from a car which went off the highway. Hundreds of persons were evacuated from Carlsbad, N. Mex., by Civil Defense personnel. Five to six feet of water was reported in some sections of the town. Many families living below Avalon Dam were evacuated as a precaution. Motorized traffic came to a virtual standstill in all directions around Carlsbad, during the height of the flooding.

An employee of Radio Station KSVP was drowned as the vehicle in which he and a state police officer were riding, was swept off the road as they attempted to reach stranded residents in Lakewood, N. Mex., 20 miles north of Carlsbad. The State Policeman managed to reach safety. Carlsbad Caverns National Park was isolated during the flooding. It was reopened to tourists on the 24th. Chaves, Lea, and Eddy Counties were declared disaster areas by the Governor.

There was also flooding in the extreme upper portion of the Colorado Basin in New Mexico and nearby west Texas. At Tatum, N. Mex., several businesses were flooded, even though protected by sand bags. At Lovington, N. Mex., merchants placed sand bags at their stores to prevent flooding. Basements of some homes and the Lovington hospital were flooded. Damage was less extensive than in the Pecos Basin.

Preliminary estimates of damage range from $100,000 to $500,000 in the Carlsbad area and up to $1 million in the flood. At least two lives were lost in the flood.

Other Floods.--The Rio Grande at Presidio, Tex., went out of its banks on the 24th and was nearly 6 feet above flood stage by the end of the month. The flooding continued into September and was due to heavy rain over the Rio Conchos Basin in Mexico. Heavy damages resulted to crops and some damages to levees, dams, and highways. The total damages were estimated at over $500,000.

Colorado Basin.--Flash floods were reported in the Colorado Basin in Arizona during August as follows:

1. Flash flooding occurred on the Agua Fria in West Phoenix and Glendale on the 9th, 12th, and 18th. There was also some stream flooding in Paradise Valley on the 18th.
2. Flash flooding occurred in the lower Gila in Dome Valley on the west side of Kofa Mountains draining into Colorado on the 19th.
3. Flash flooding occurred in the vicinity of Globe and on Fish Creek, a tributary of the Salt River.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations Relative humidity averages are limited to those observations with temperatures warmer than -40°C Observations of wind speed and direction are sometimes lost due to limiting angles, i.e. elevation angles less than 6° above the horizon, or any obstruction above the horizon
The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available
Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.
These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G. C. T.

R More than half of the observations are from statistical values. Equipped with lithium chloride hygristor.

S Slight haze - indeterminable
M Moderate haze - indeterminable
I Intense haze - indeterminable
* Values corresponding to true solar noon

HS Slight haze
HM Moderate haze
HI Intense haze

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Station	Day of month

NET RADIATION

Net radiation in langleys per day (midnight to midnight) at Huntley, Mont.

AUGUST 1966

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	354	385	286	374	271	402	373	360	367	305	185	351	337	296	353	344	344	*	*	*	*	*	*	*	*	*	*	*	*	416	244	---

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

* recorder malfunction Aug. 18-29

These data are of an experimental nature and are published as received from the Huntley Exp. Station. The instrument with which they were measured has not been checked by the Weather Bureau.

TOTAL OZONE DATA

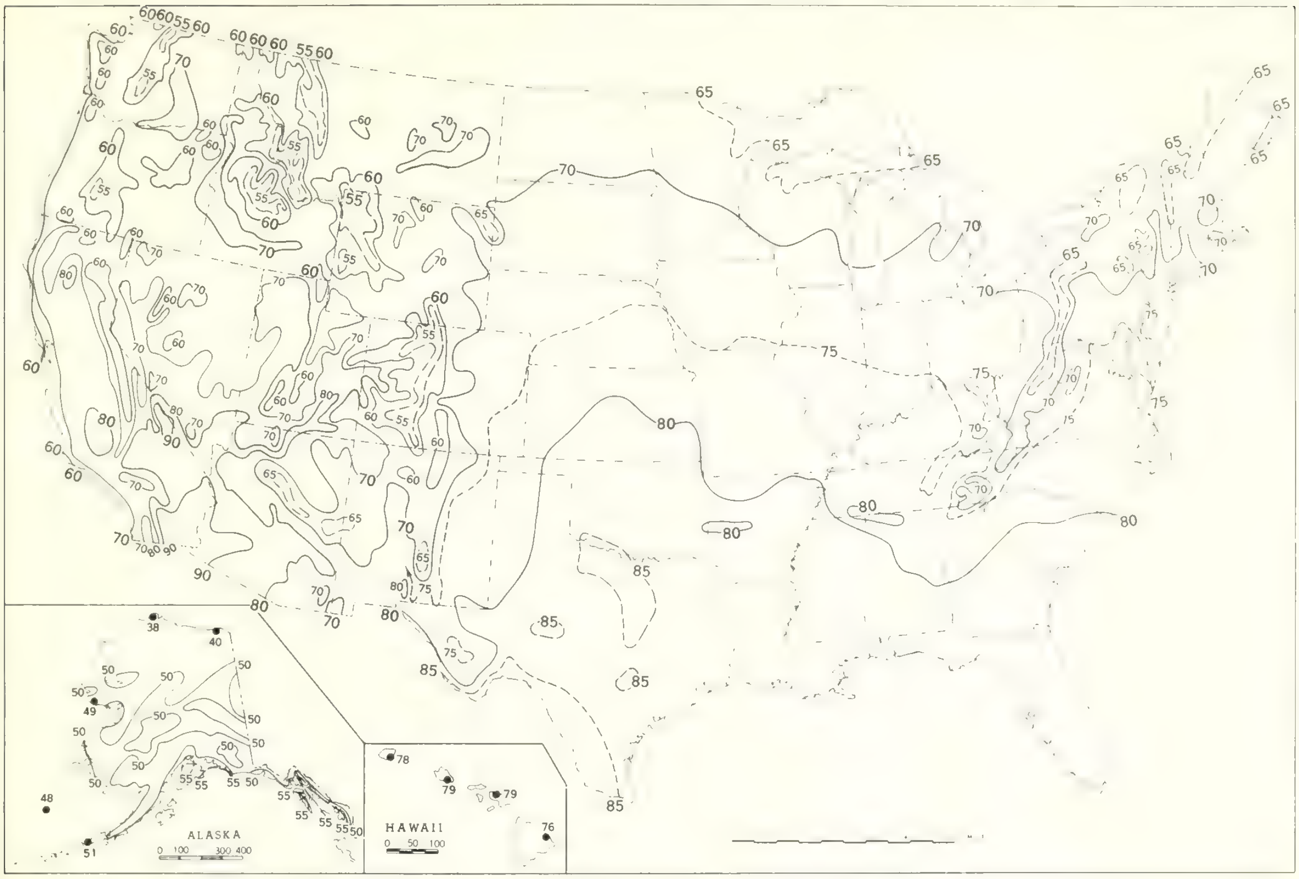
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λs Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

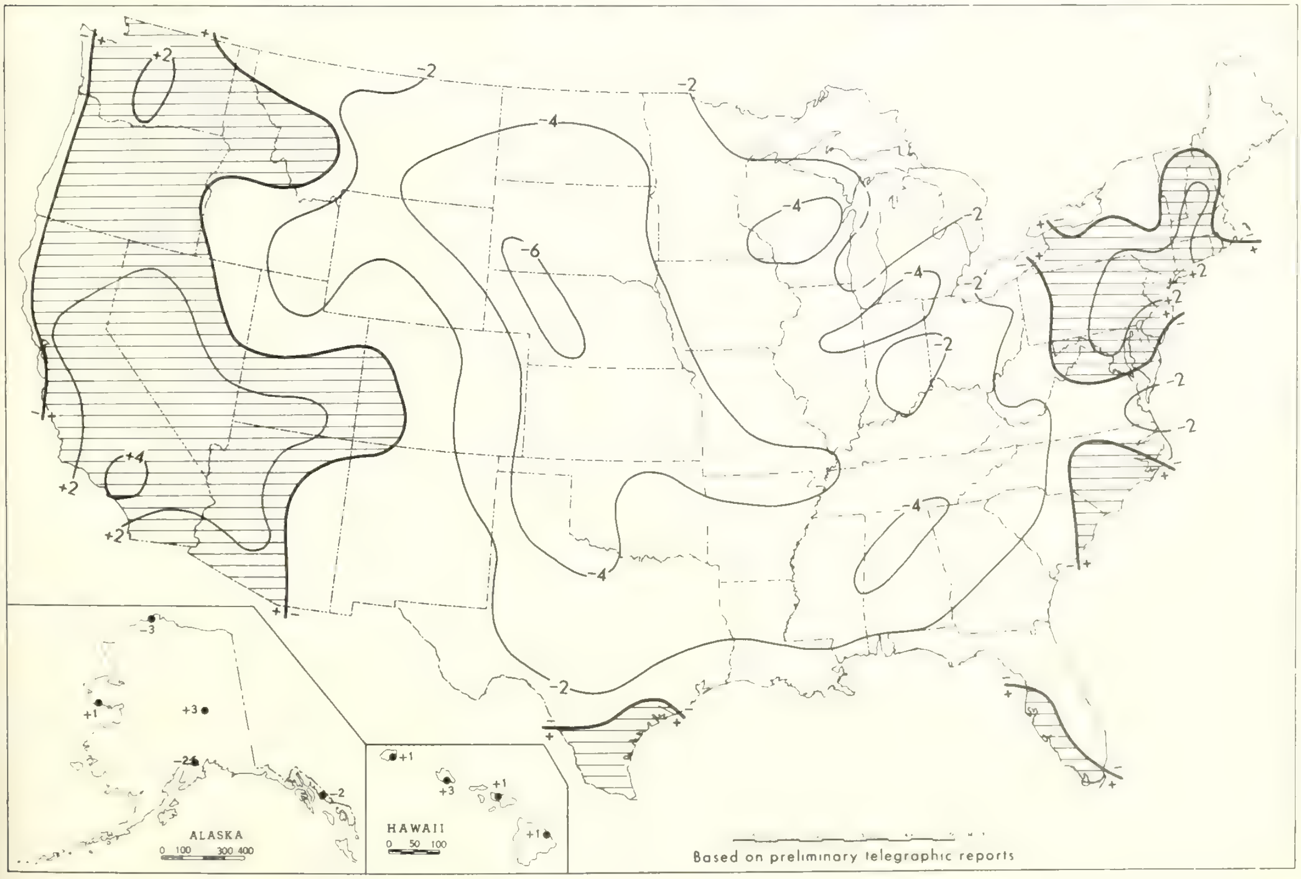
Station	Day of month																														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i e , the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g , 350 milli-atmo-cm ozone implies an ozone layer 0 350 centimeter thick The code λs designates the type of measurement made

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), August

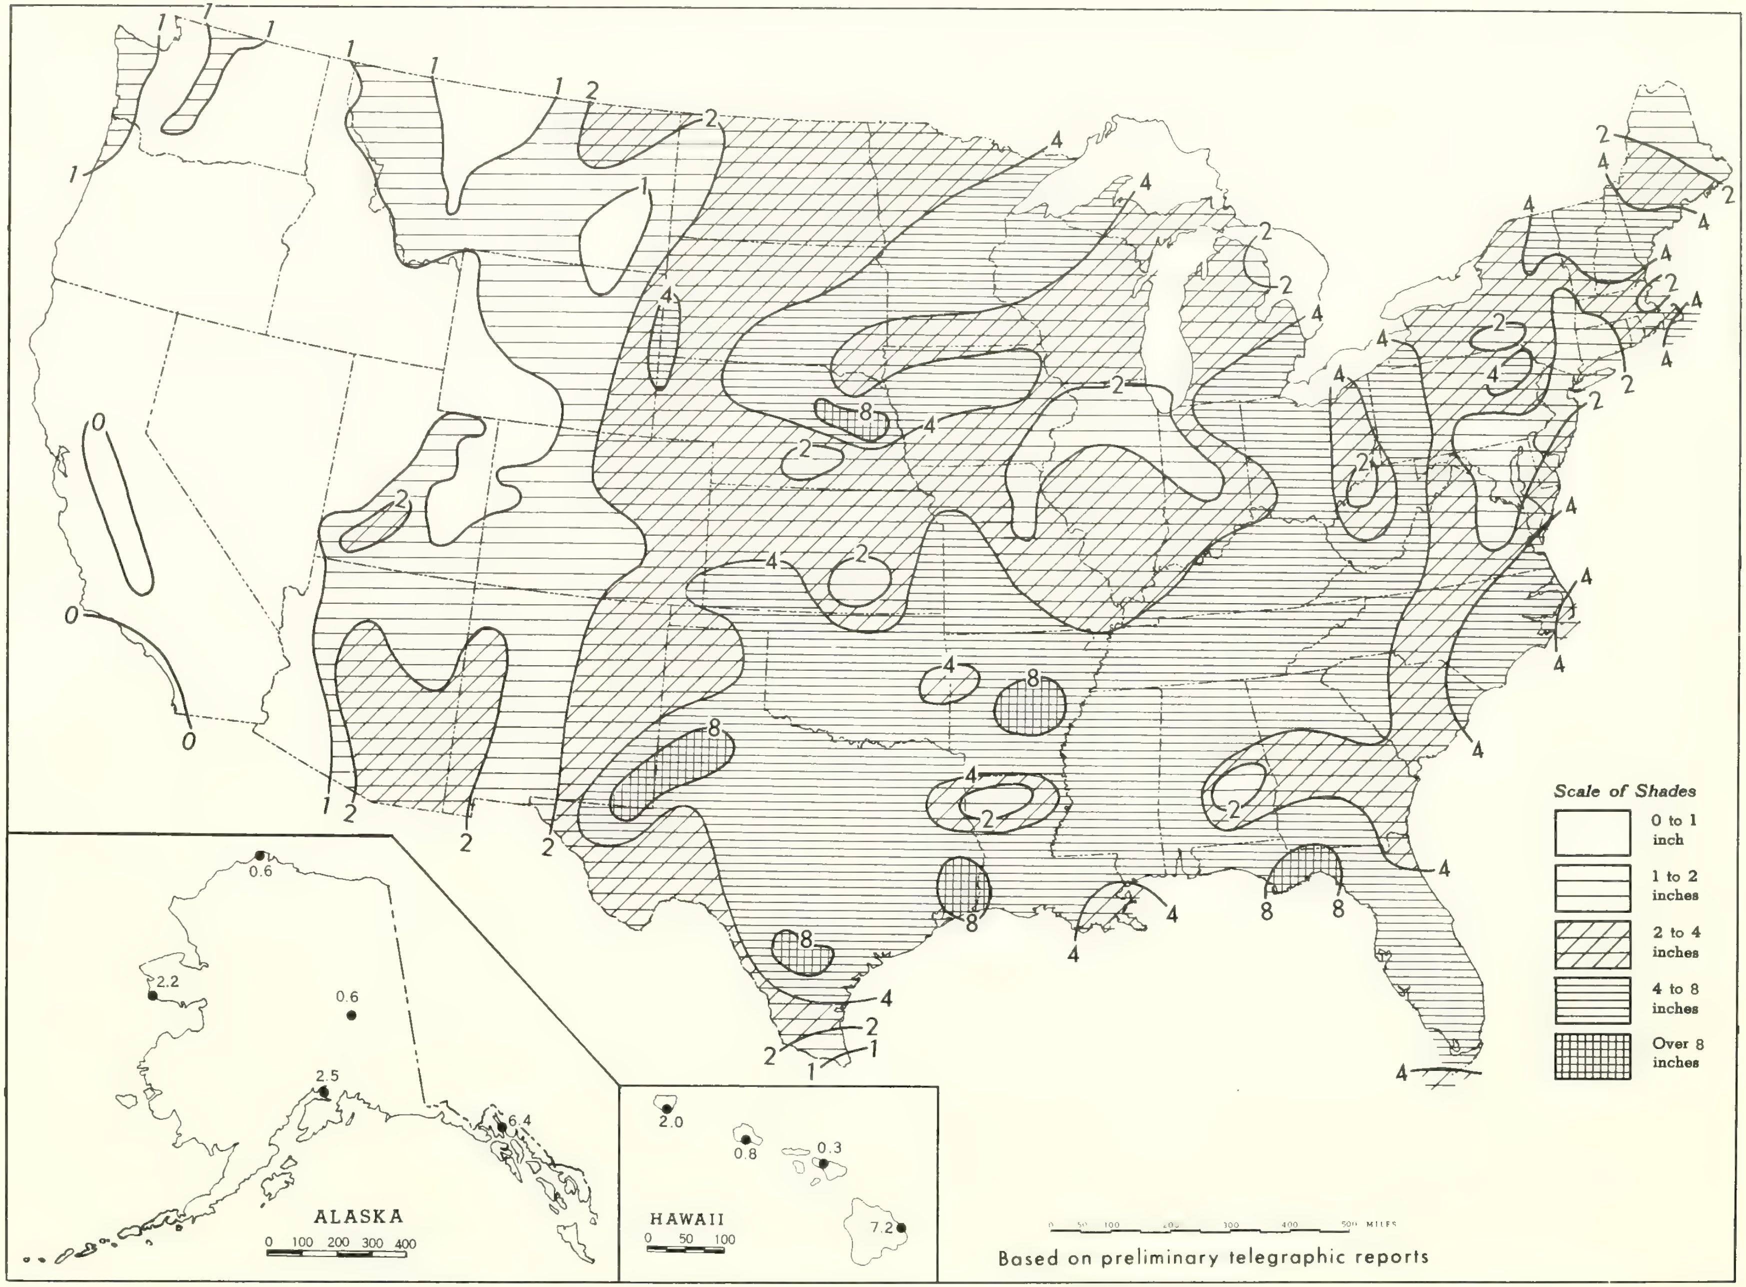


B. Temperature Departure from 30 - Year Mean (°F 1931-60), August 1966.



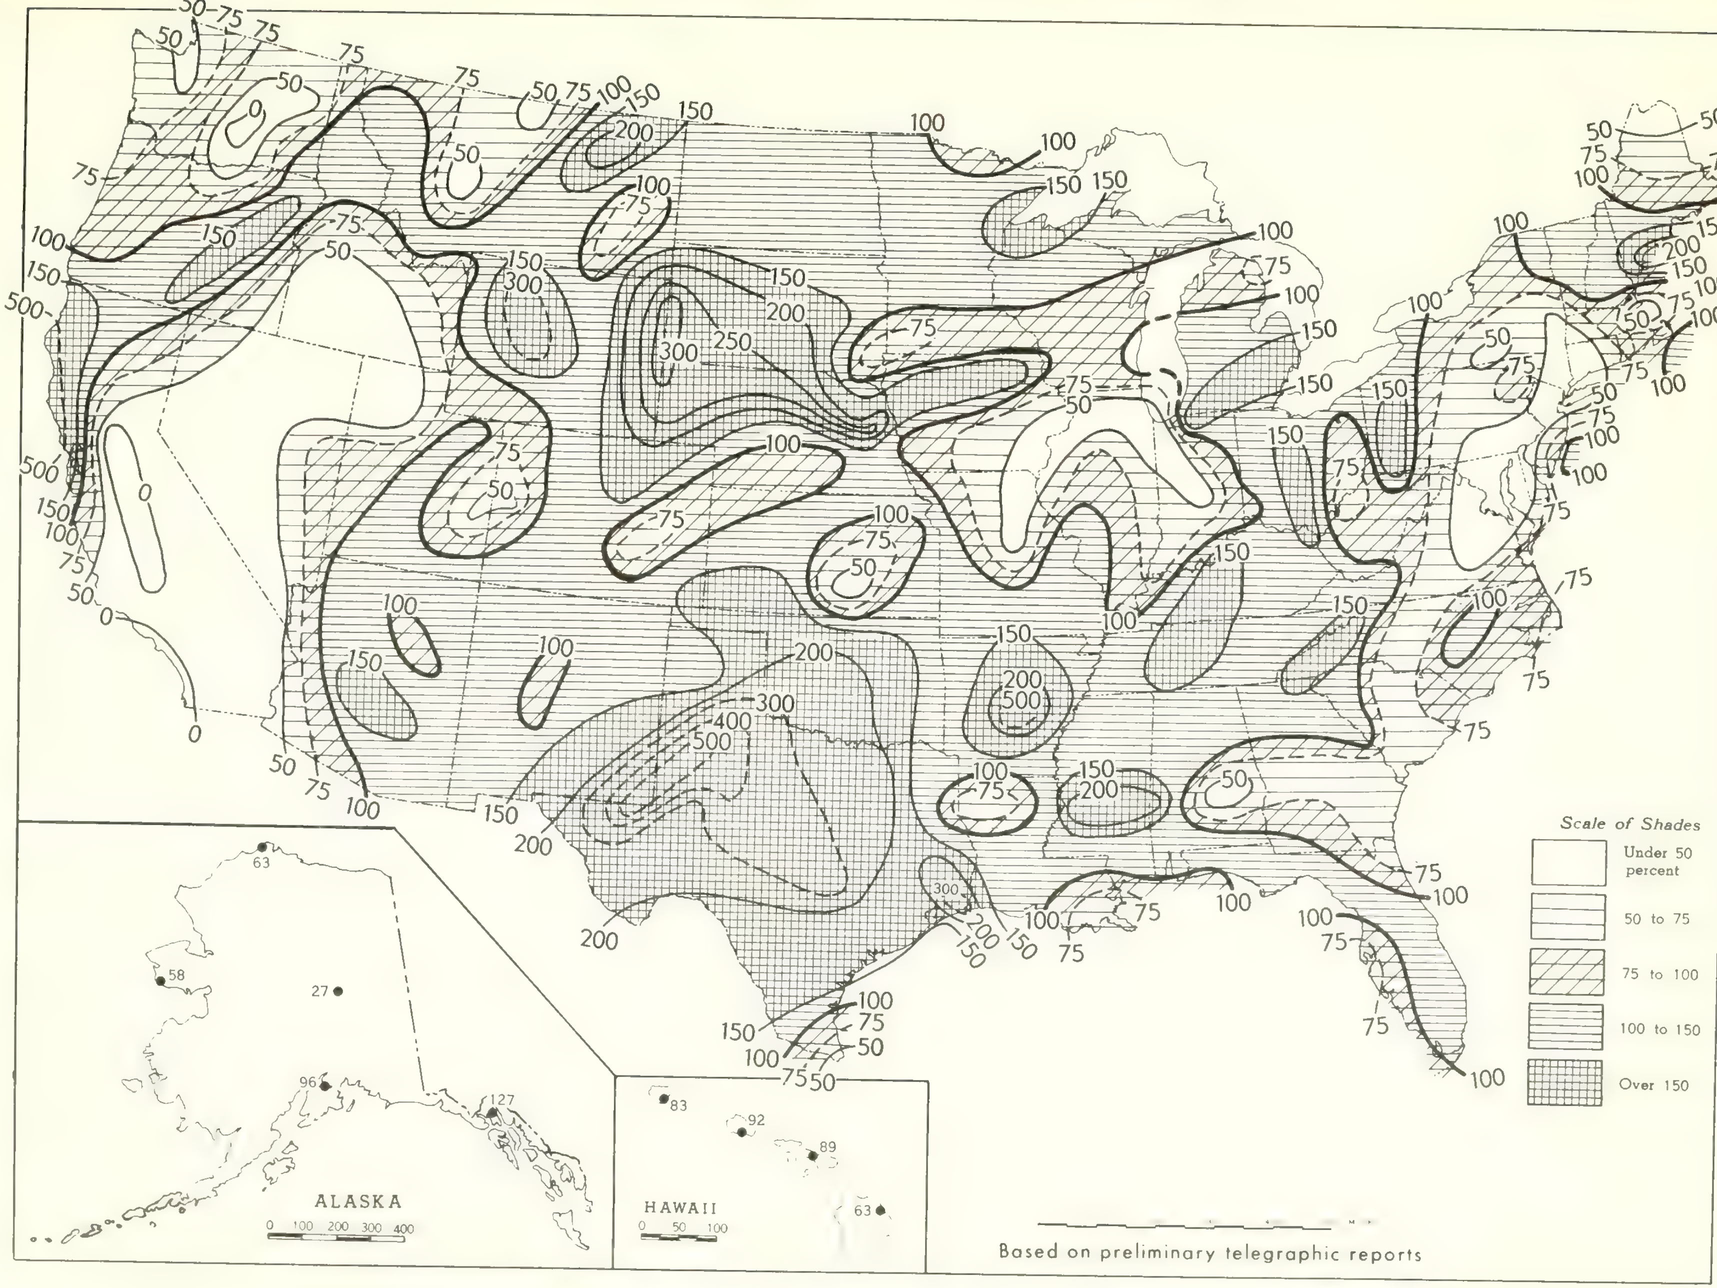
Based on preliminary telegraphic reports

Chart II. Total Precipitation (Inches), August 1966.



Based on preliminary telegraphic reports

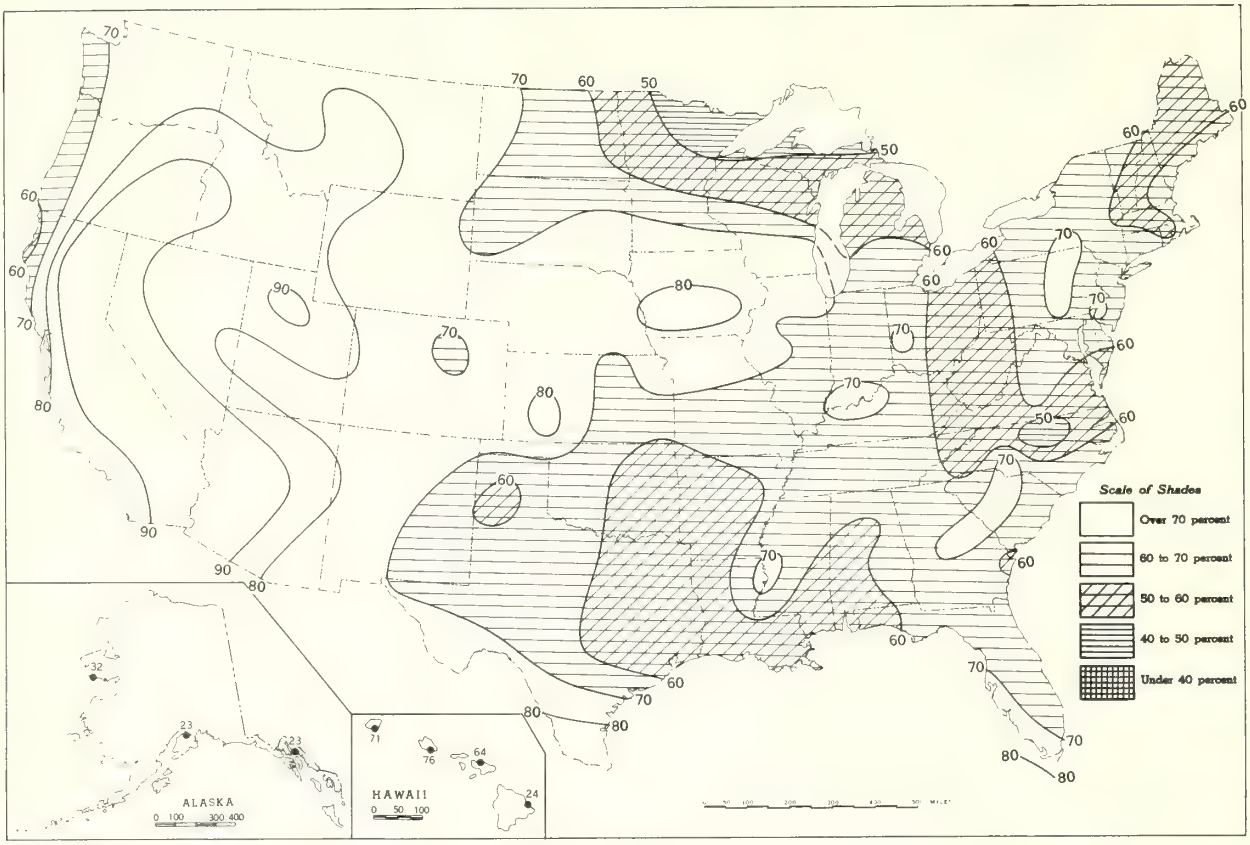
Chart III. Percentage of Normal Precipitation, August 1966.



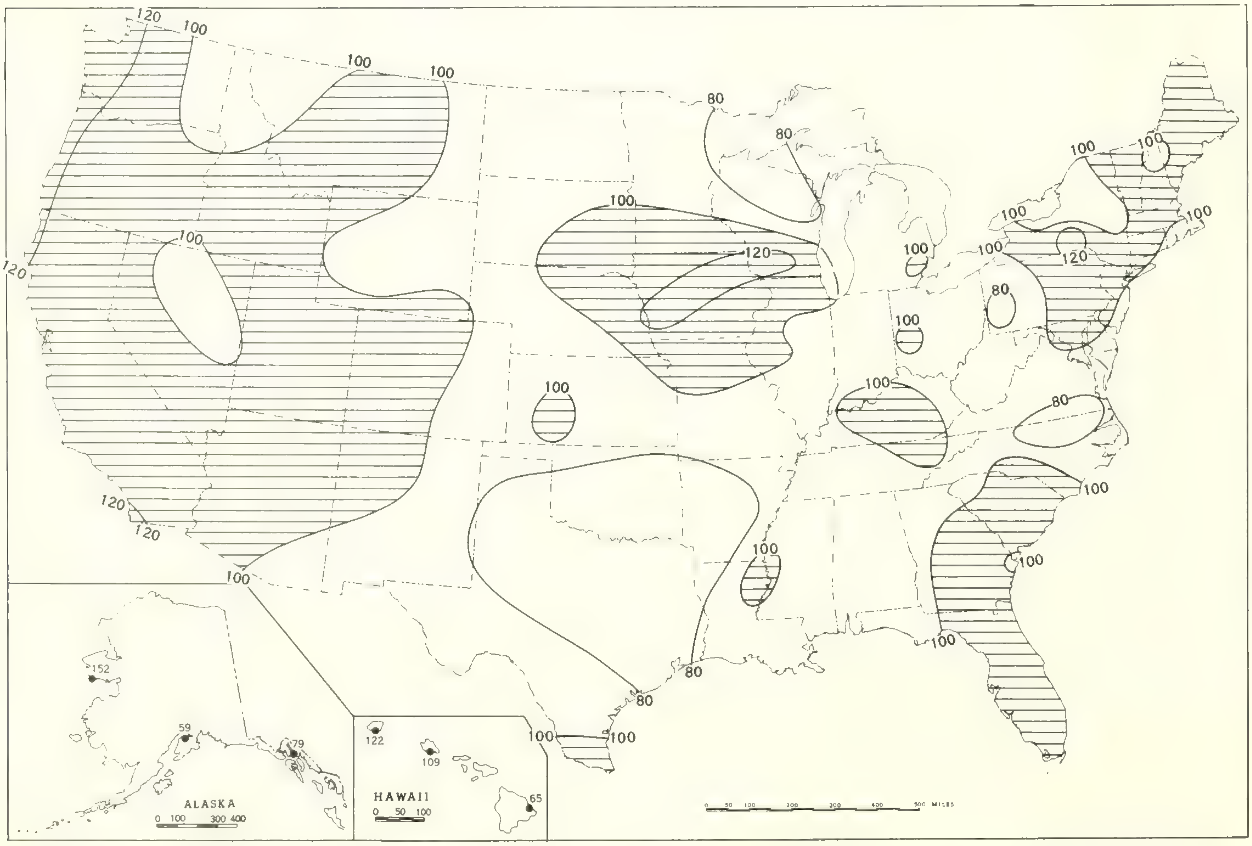
Based on preliminary telegraphic reports

Normal monthly precipitation amounts are computed from 30 yr. normals (1931-60) for first-order Weather Bureau stations.

Chart VI. A. Percentage of Possible Sunshine, August 1966.

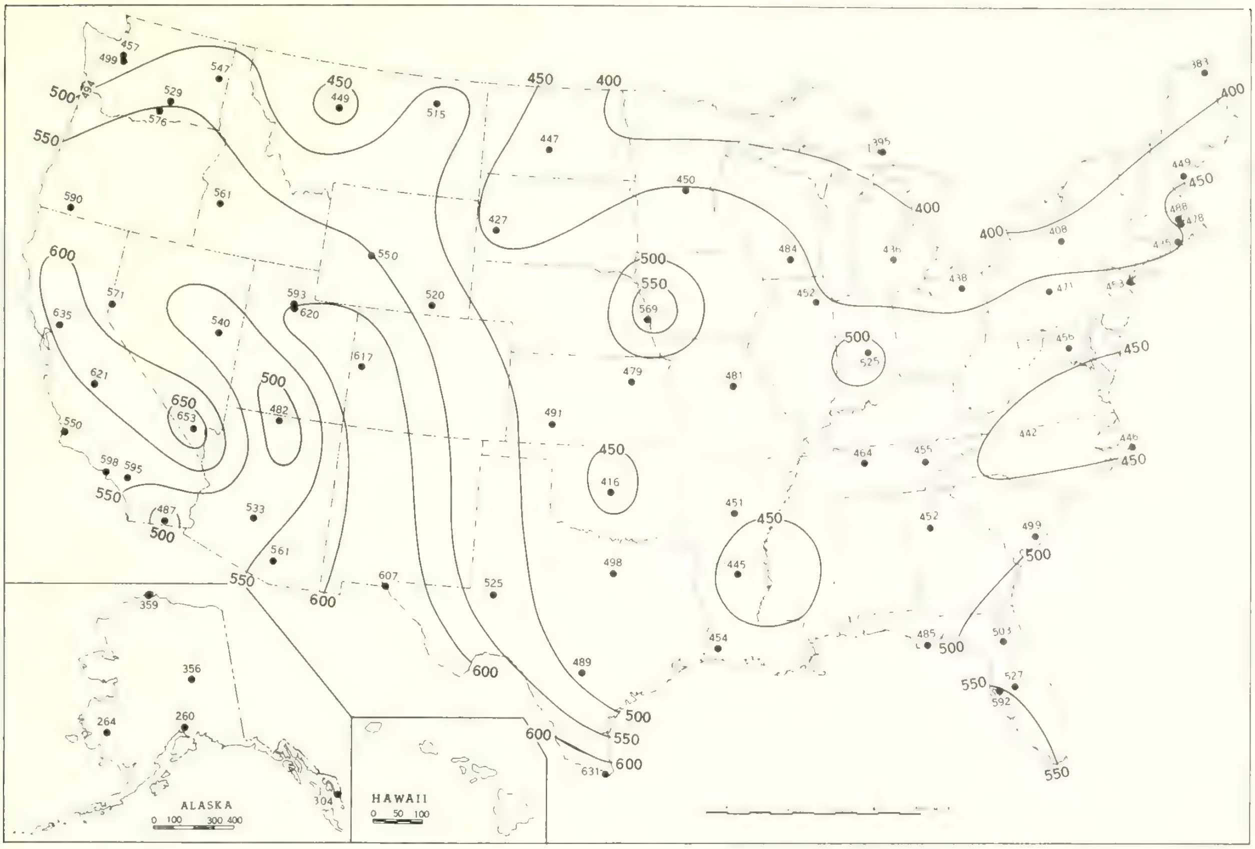


B. Percentage of Mean Monthly Sunshine, August 1966.

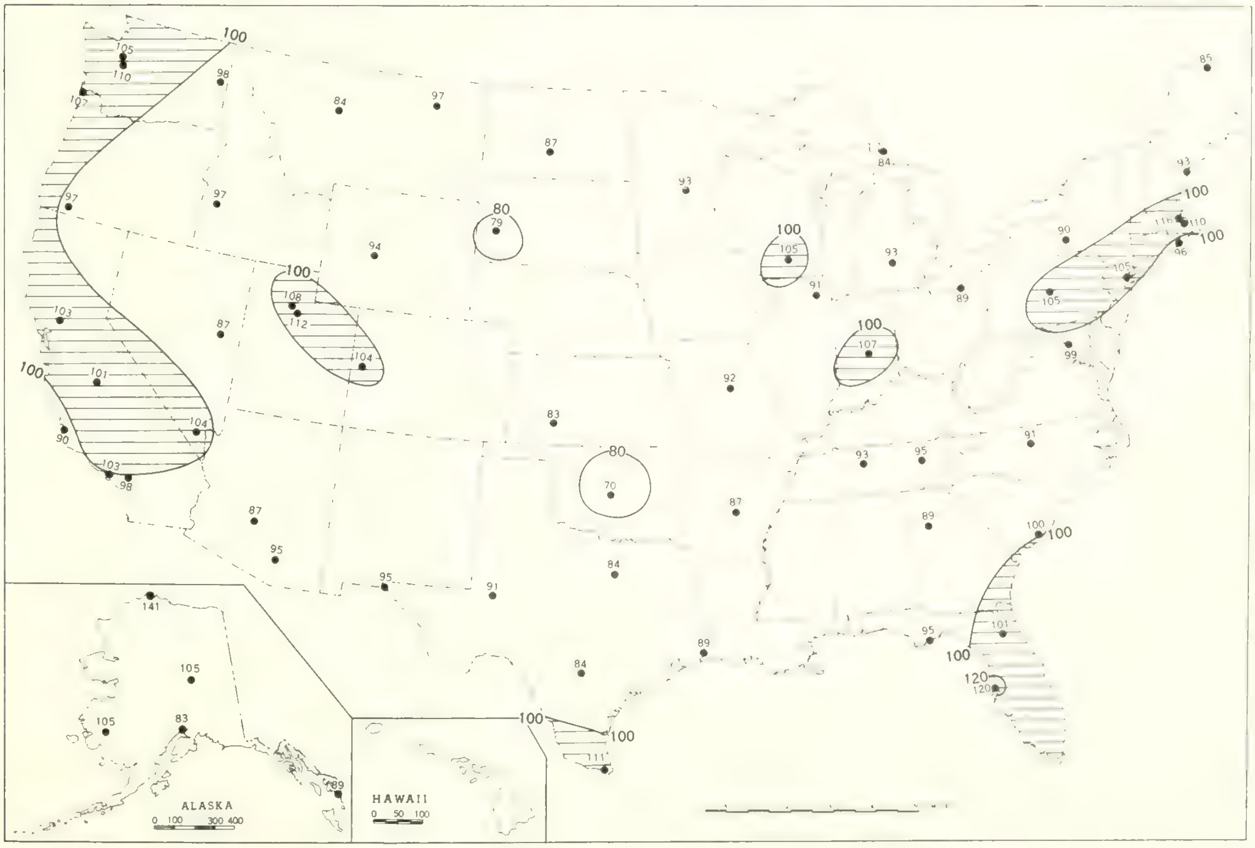


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, August 1966.

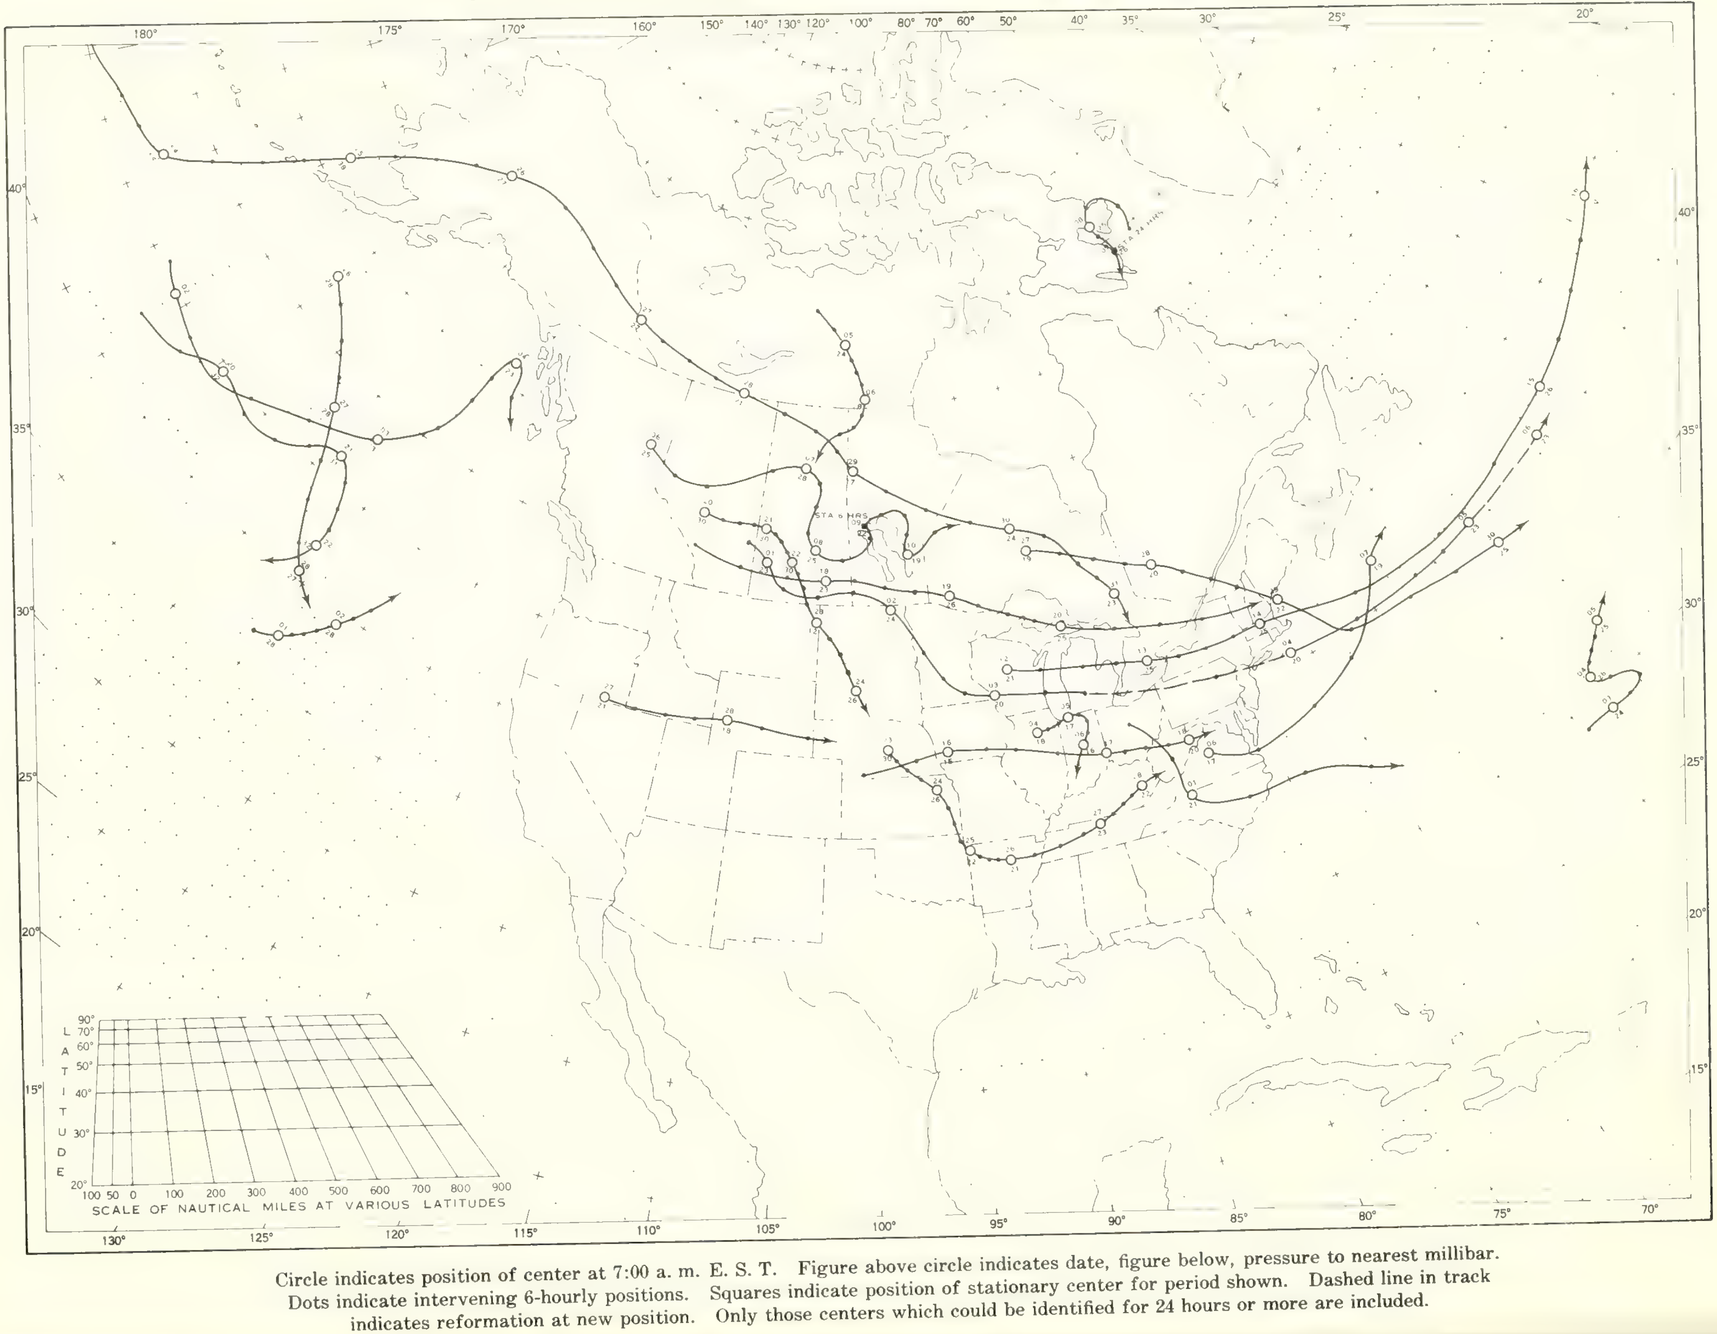


B. Percentage of Mean Daily Solar Radiation, August 1966.



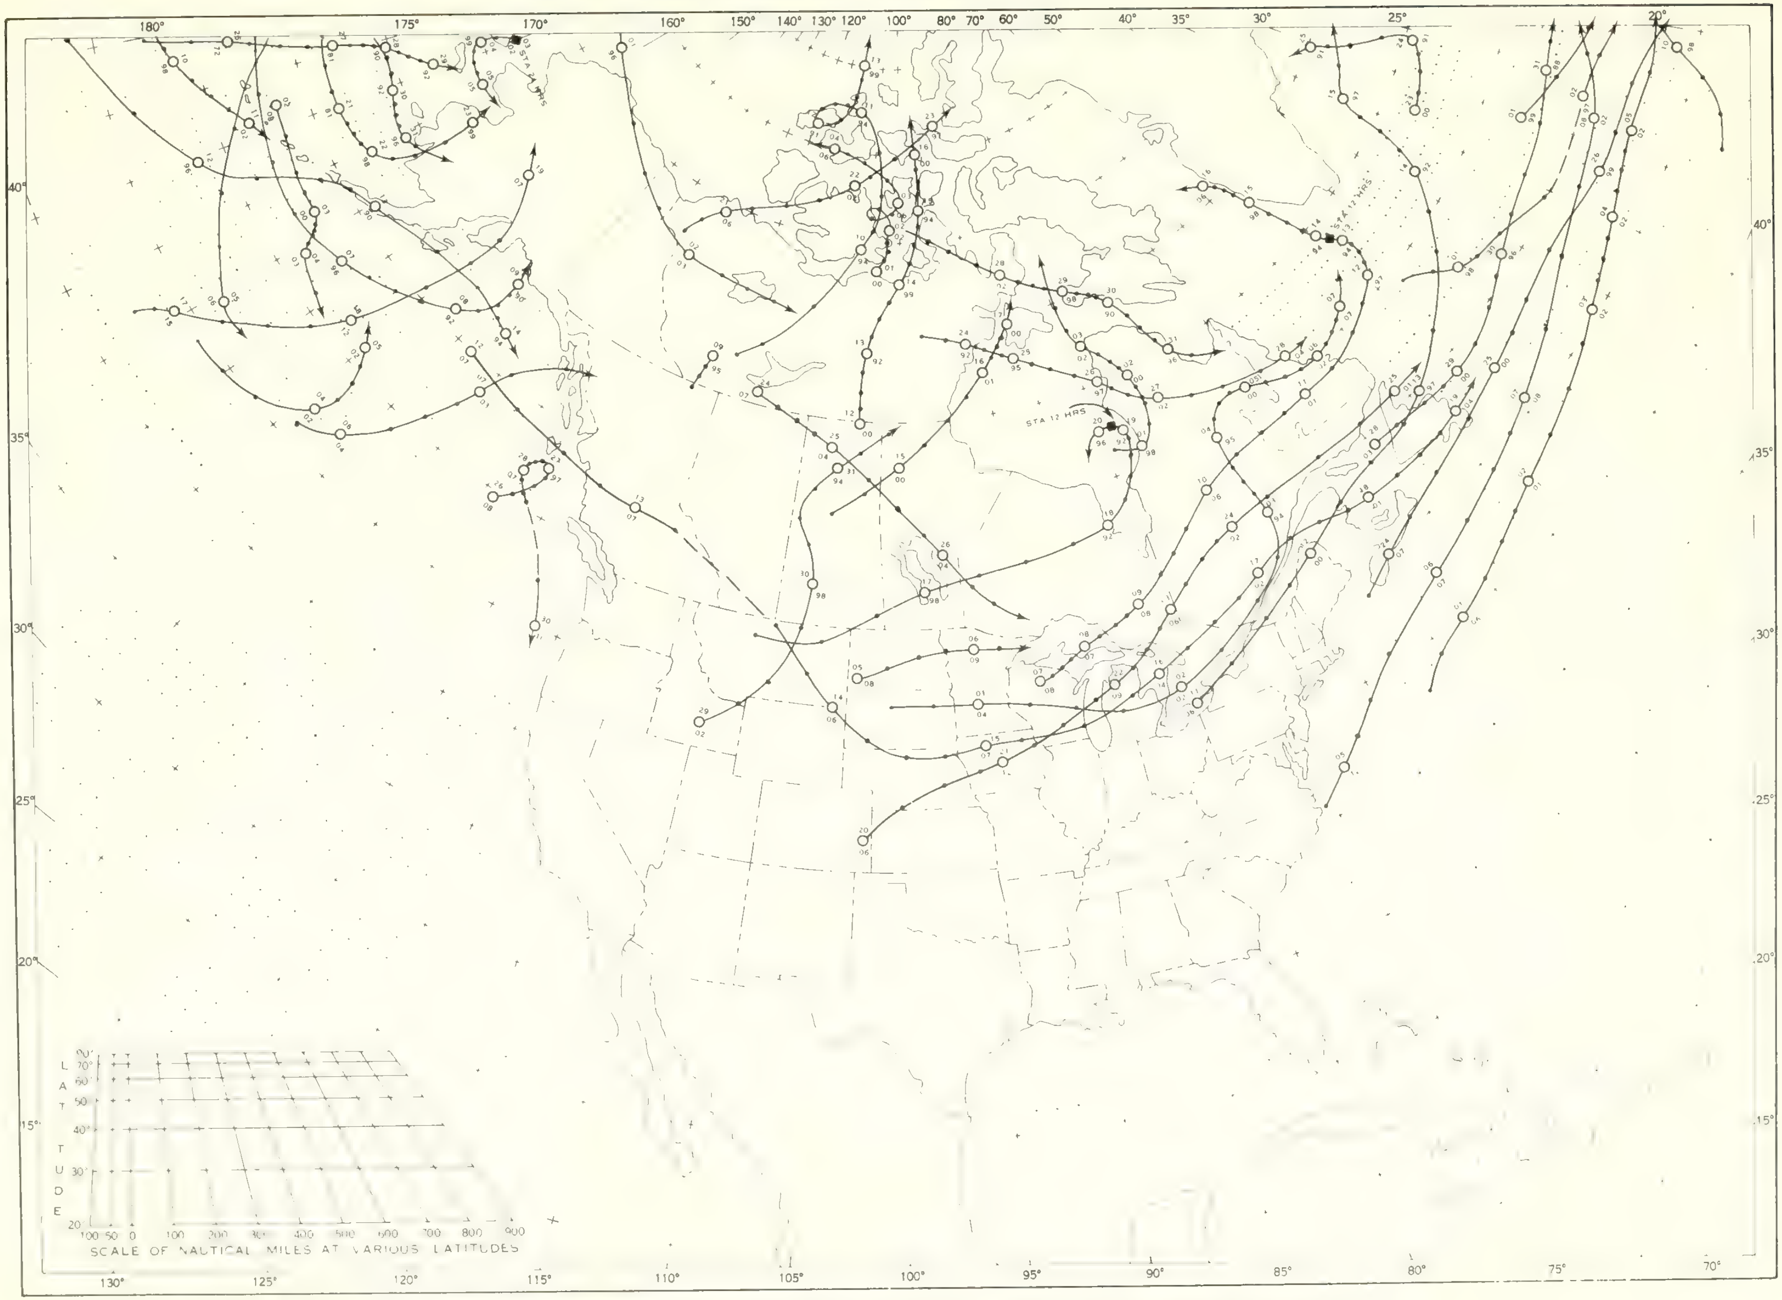
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, August 1966.



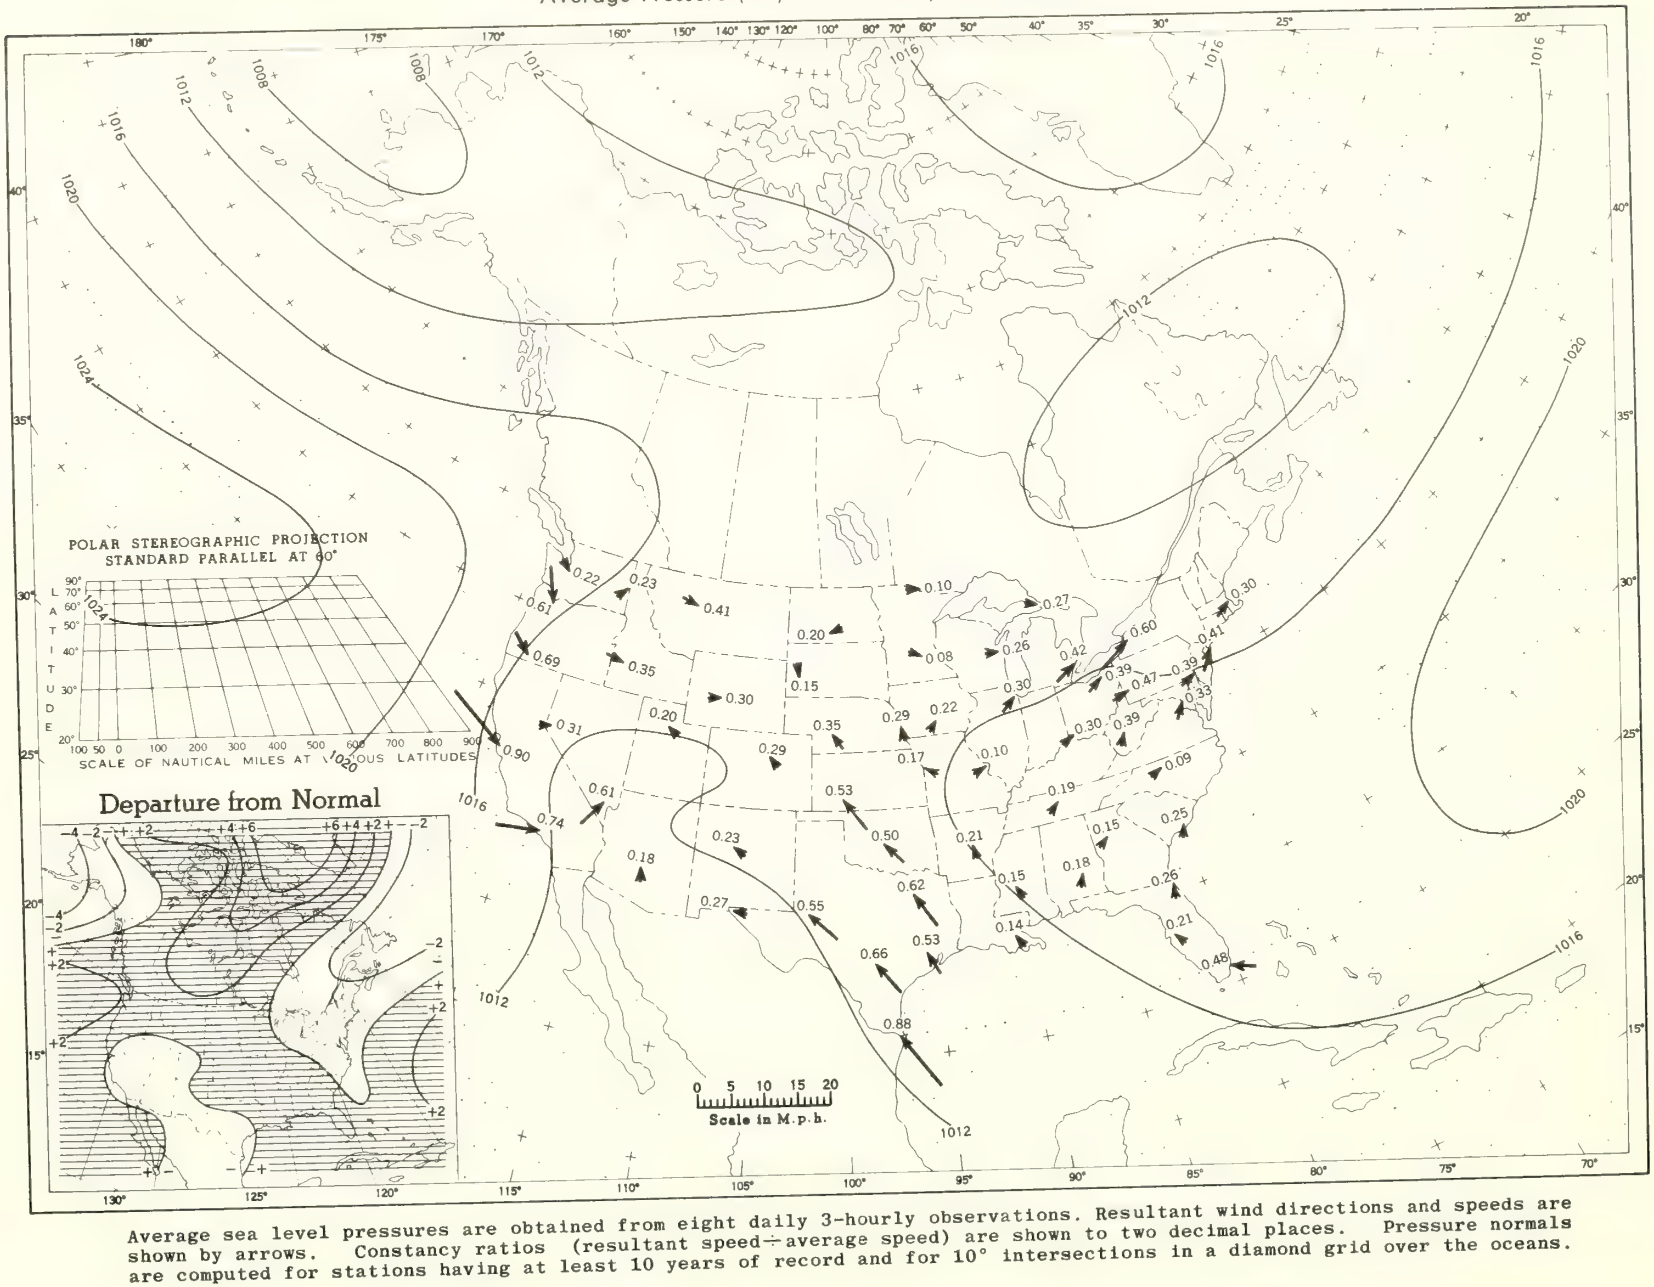
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, August 1966.



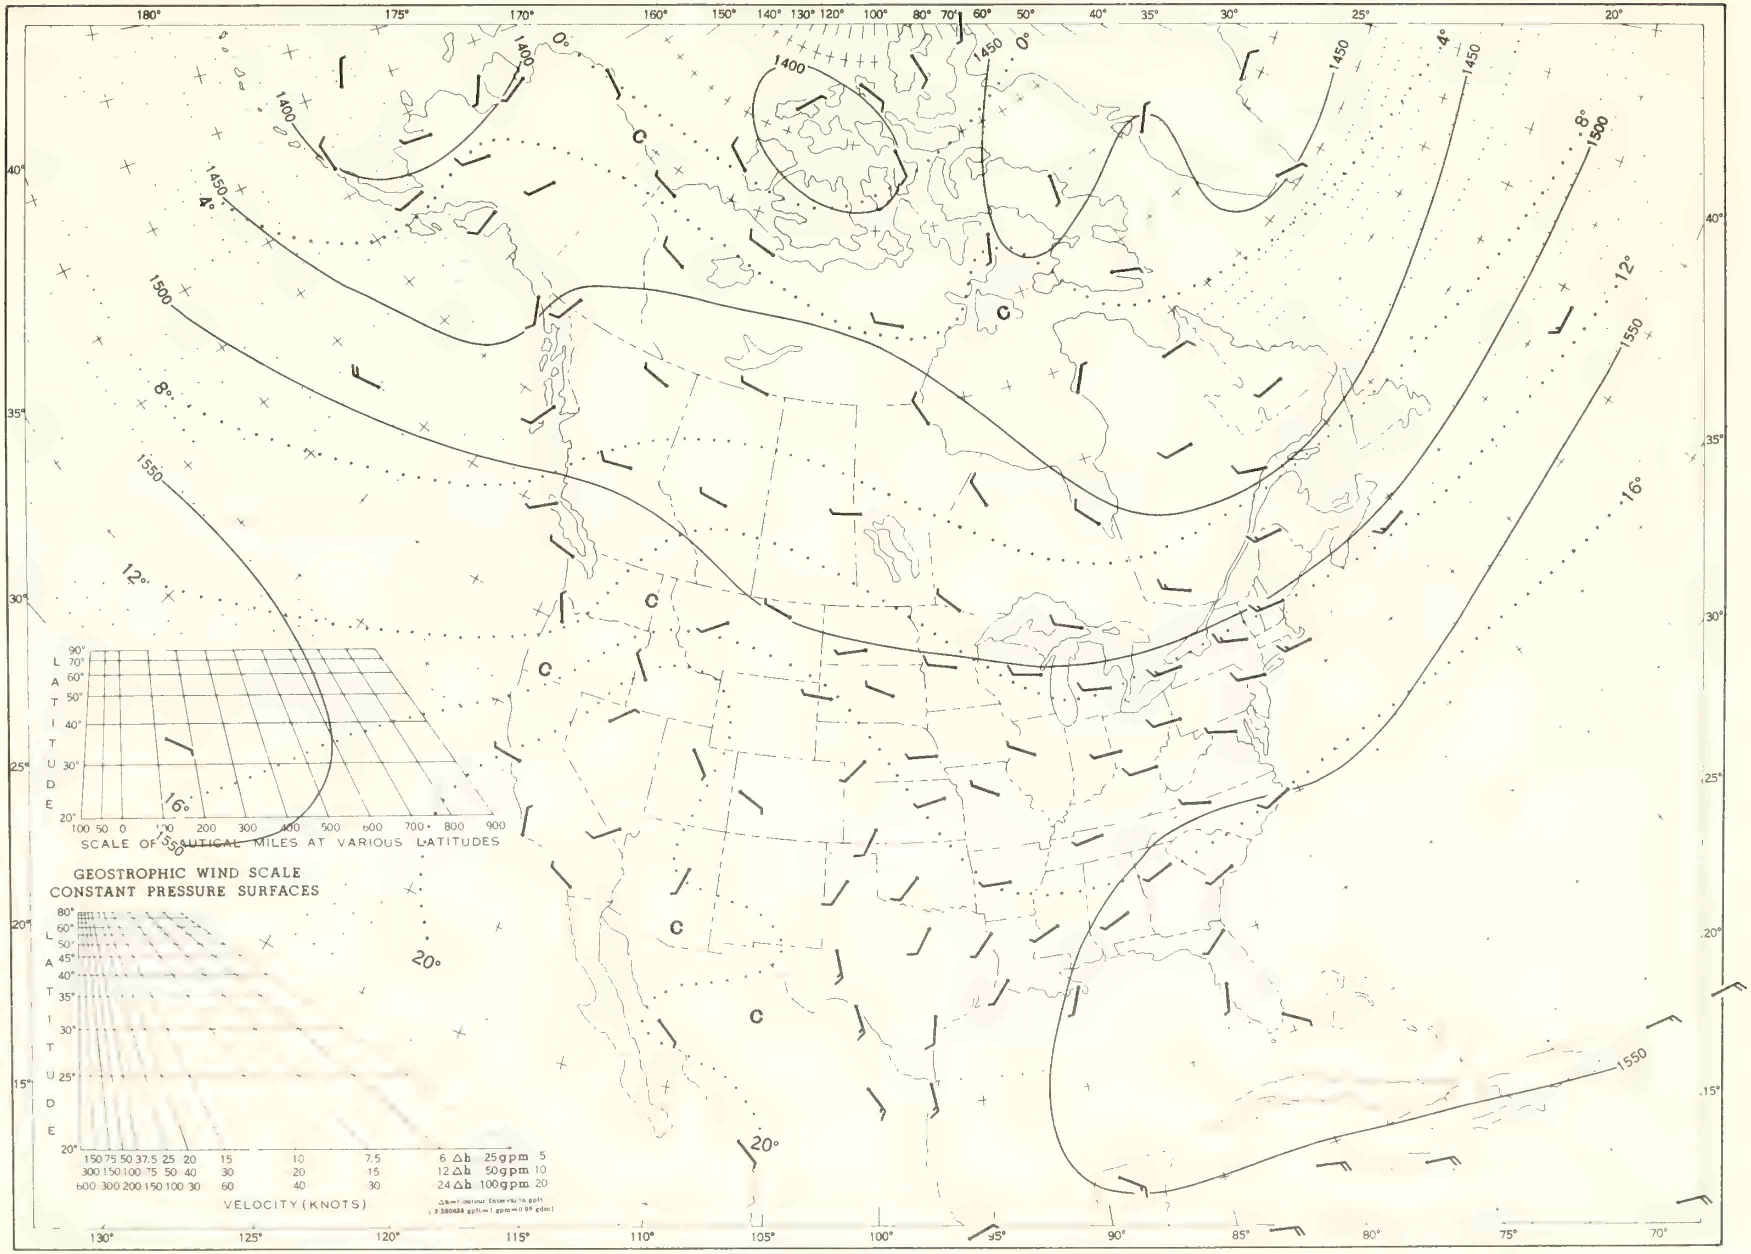
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, August 1966. Inset: Departure of Average Pressure (mb) from Normal, August 1966.



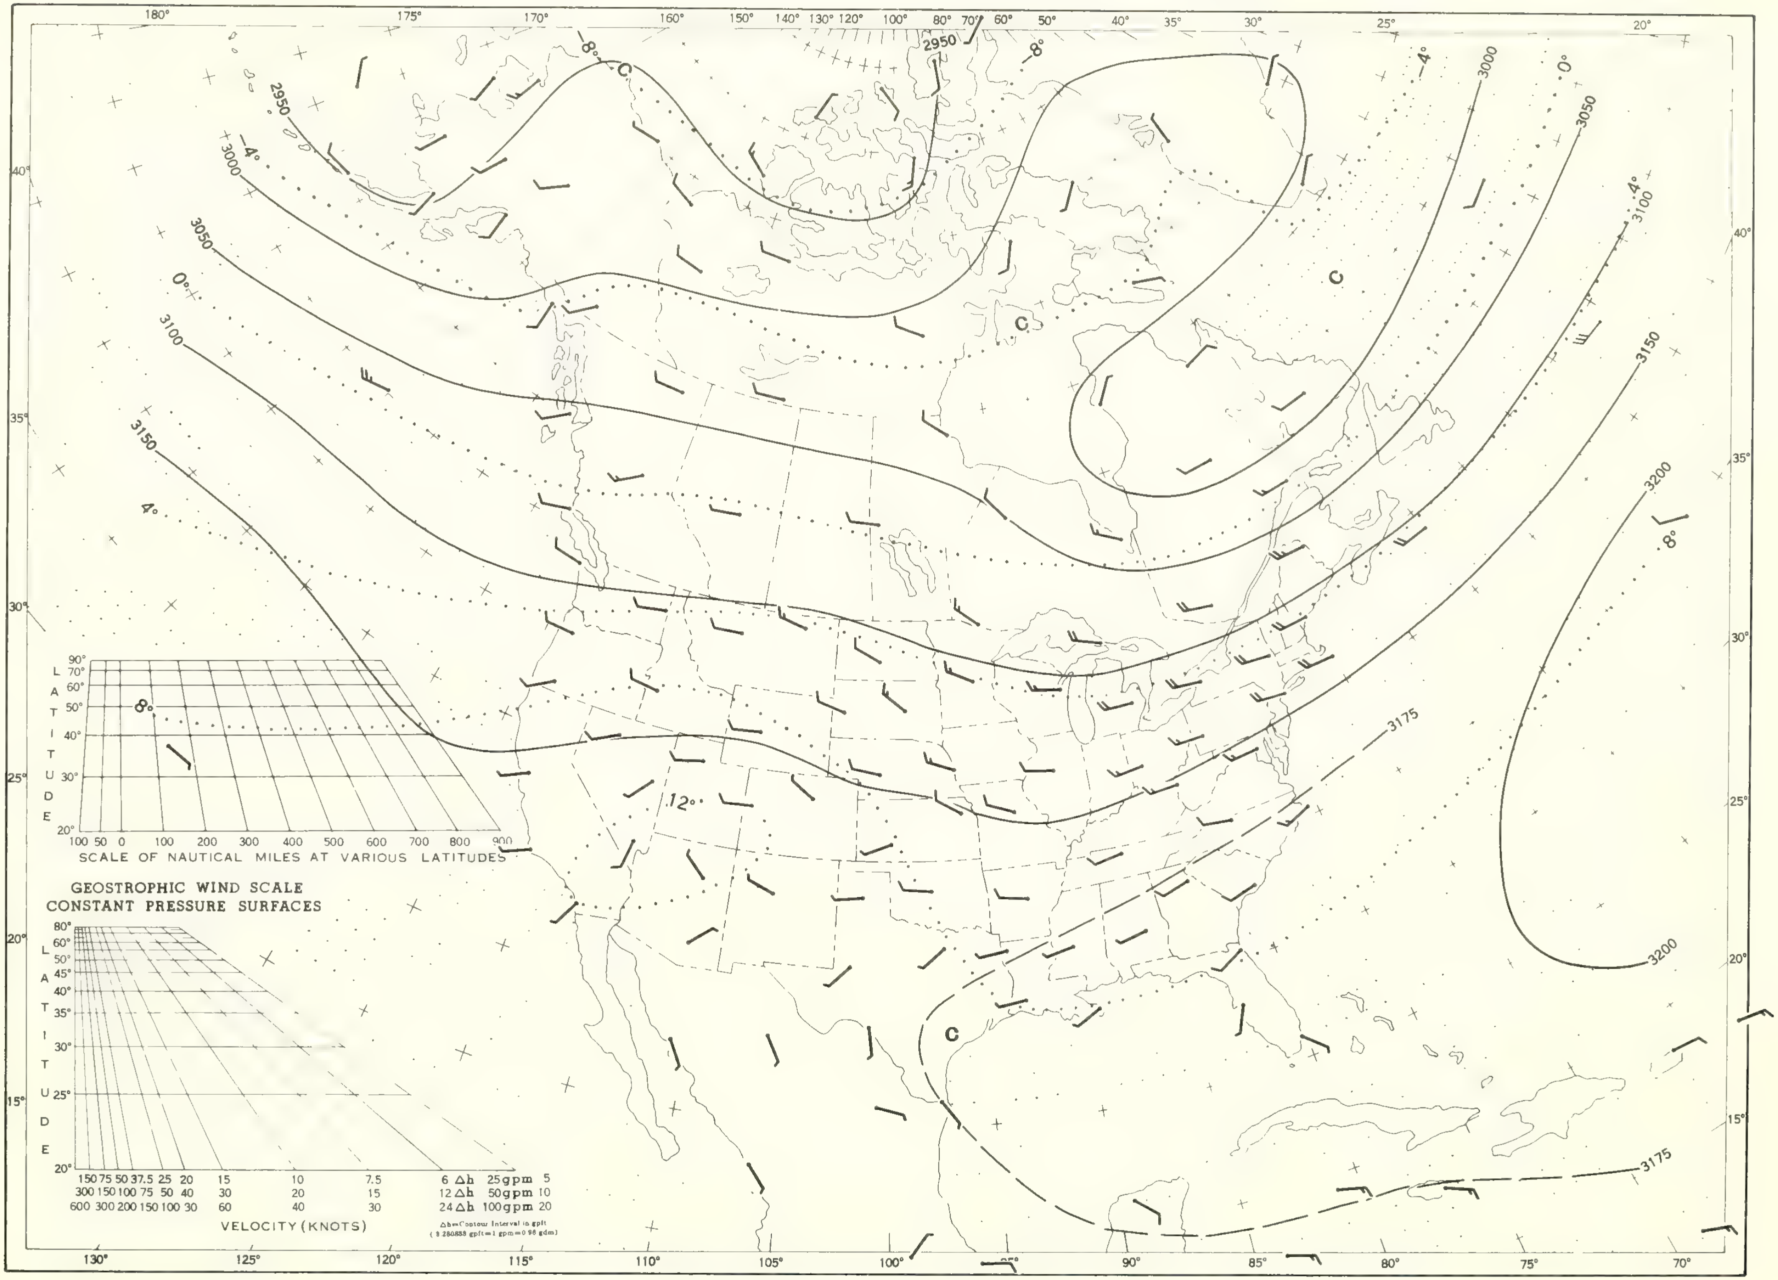
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, August 1966. Average Height and Temperature, and Resultant Winds.



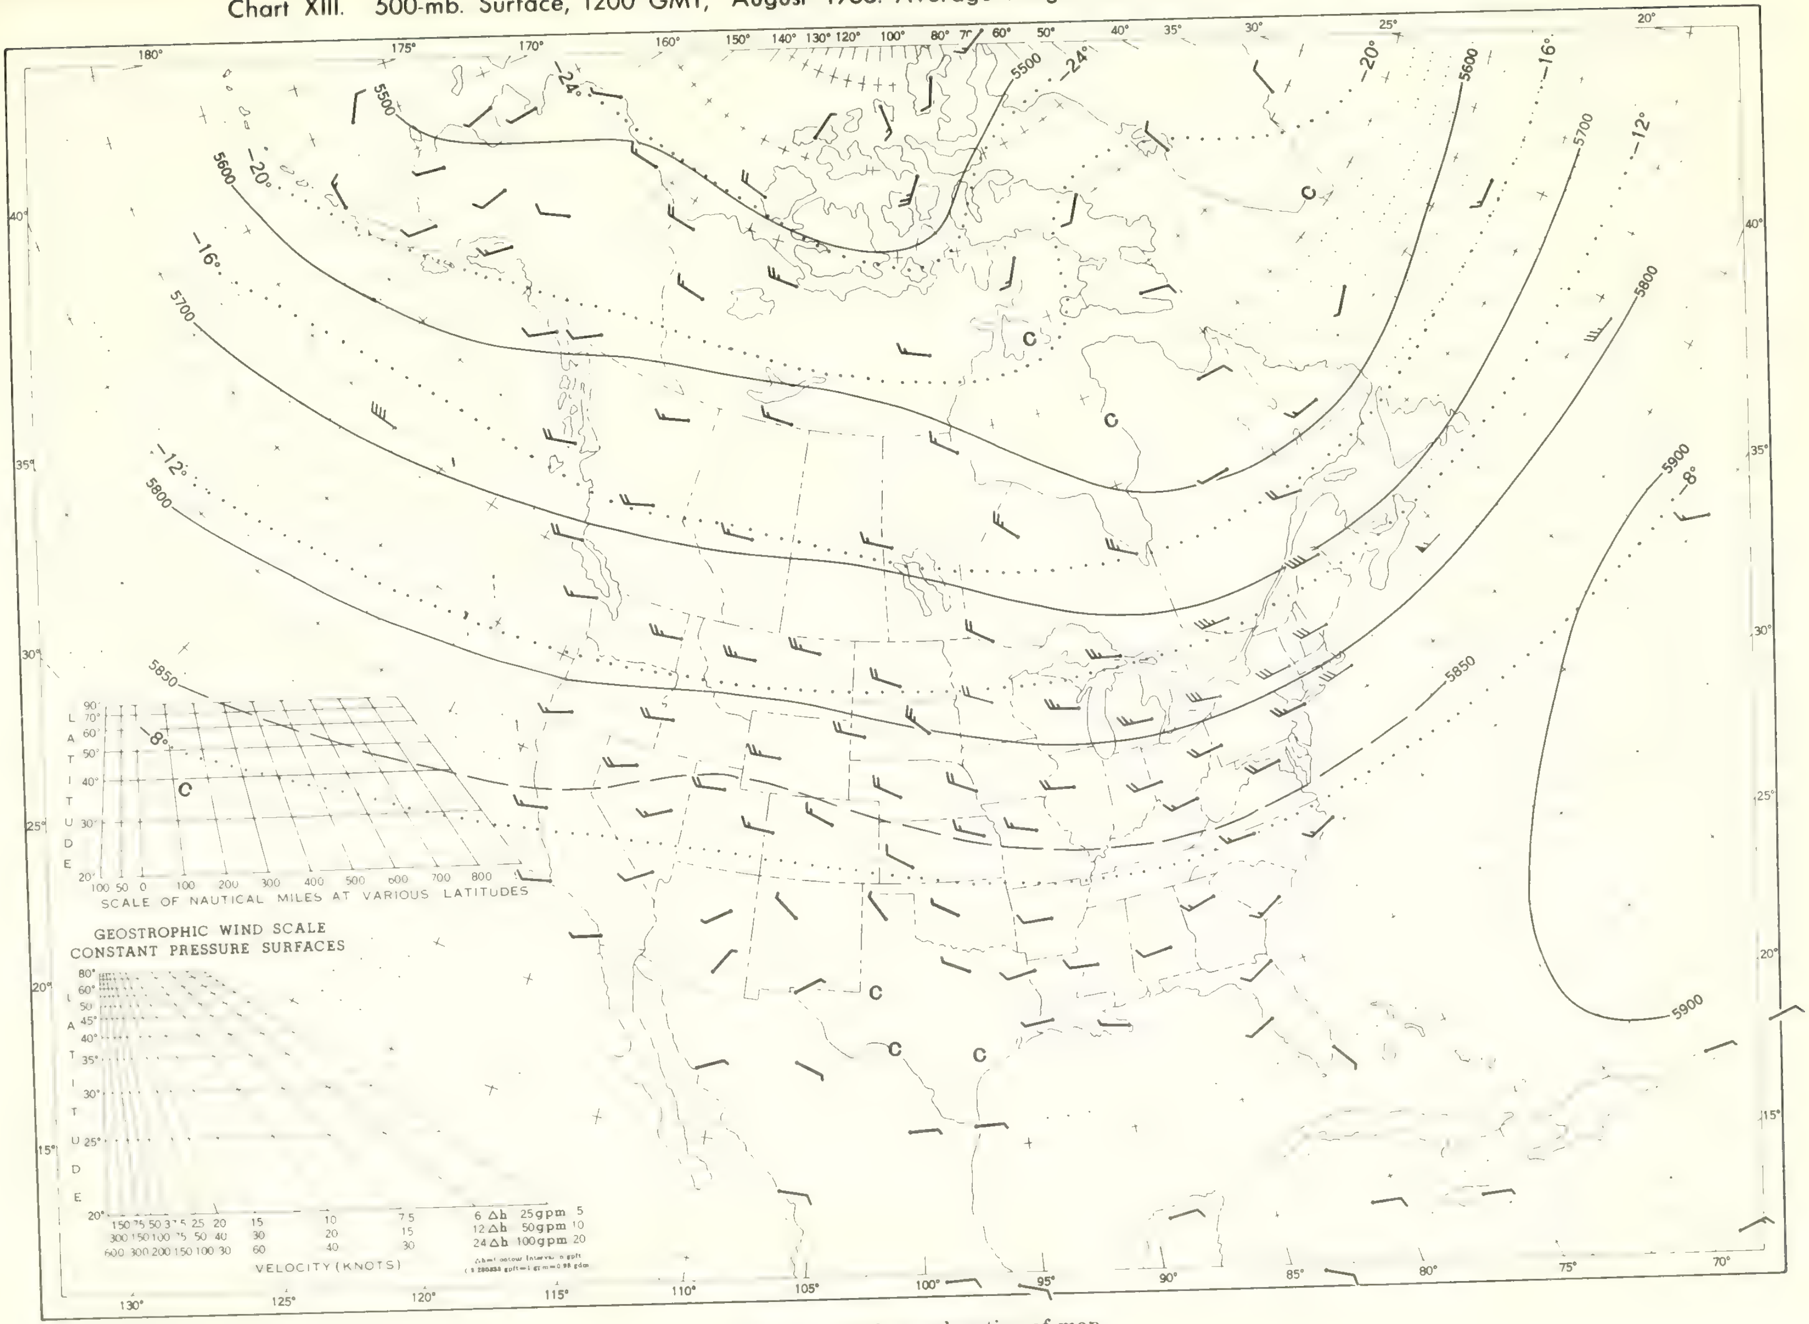
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, August 1966. Average Height and Temperature, and Resultant Winds.



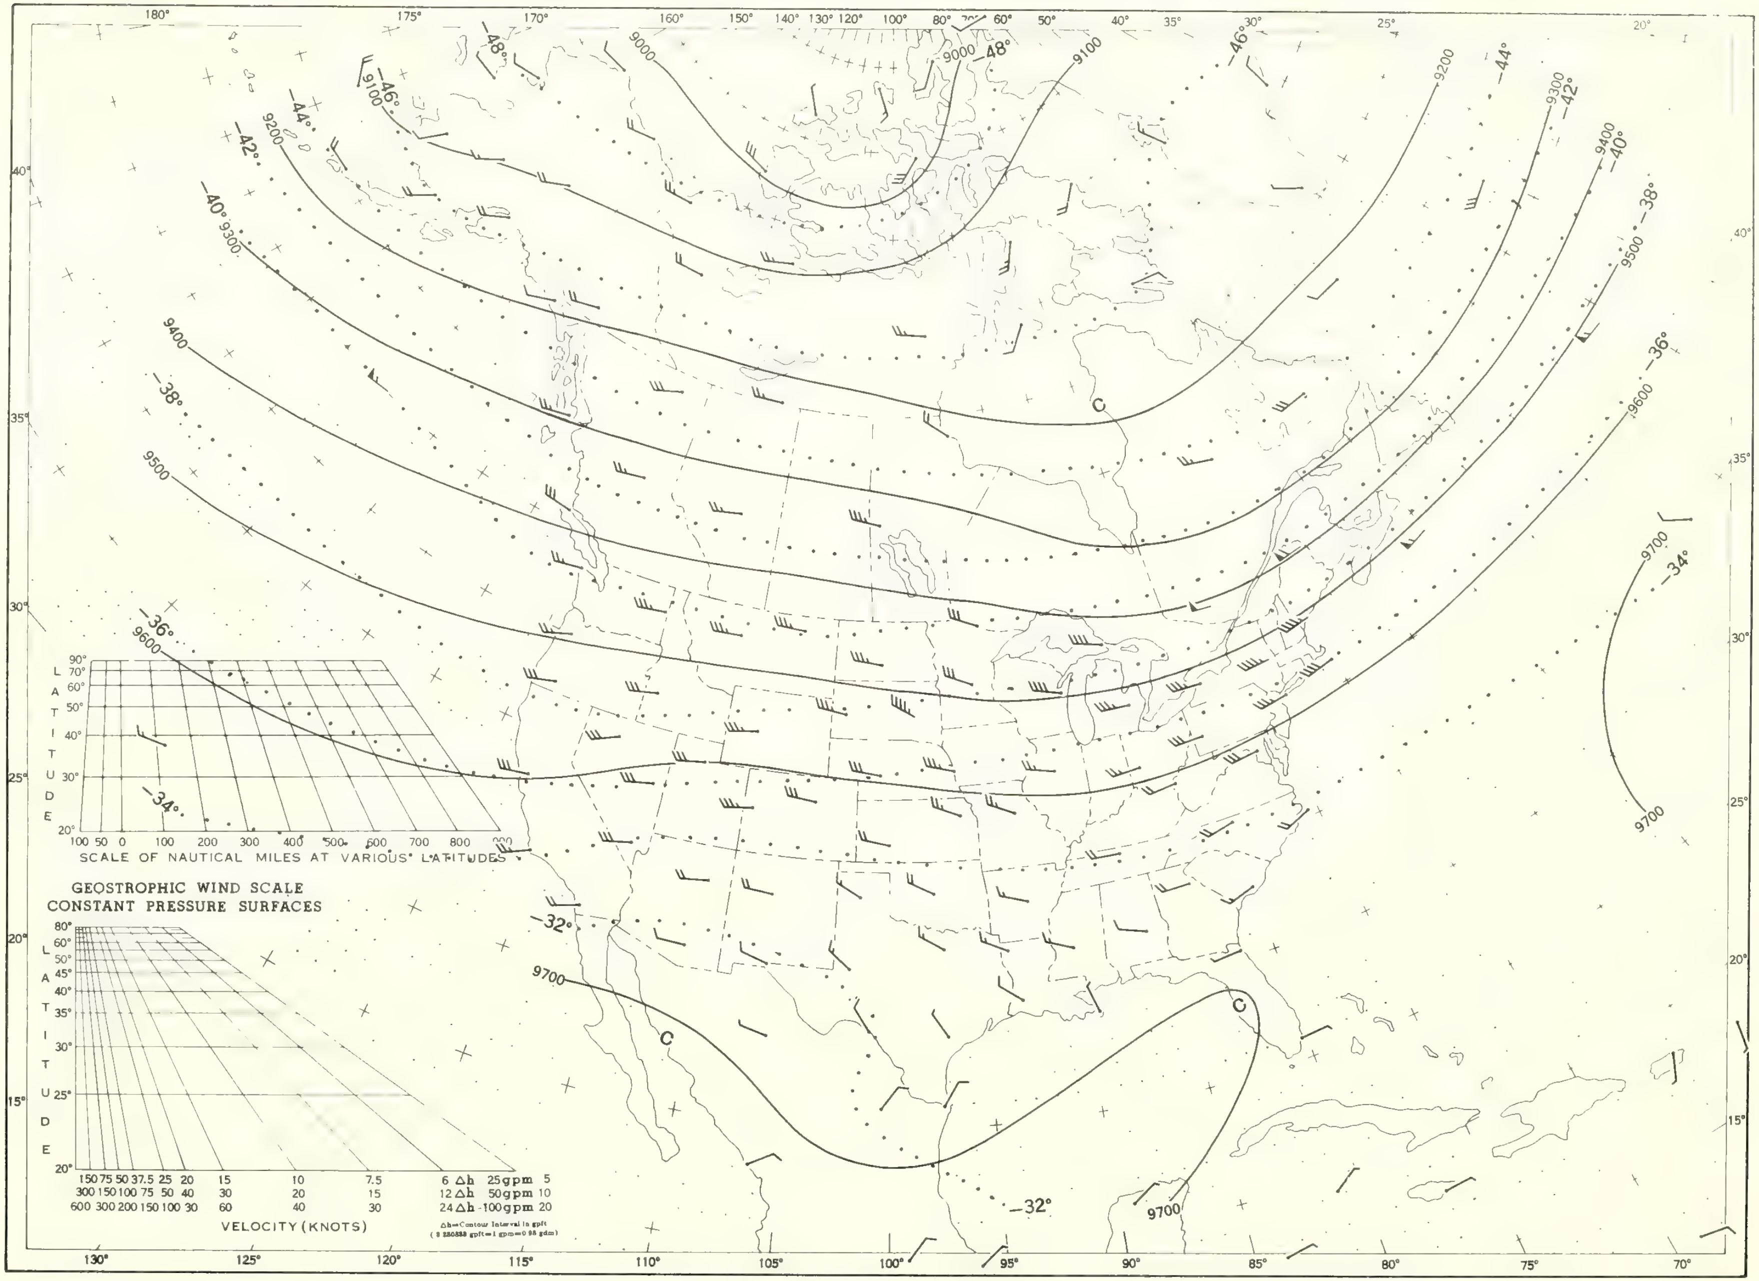
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, August 1966. Average Height and Temperature, and Resultant Winds.



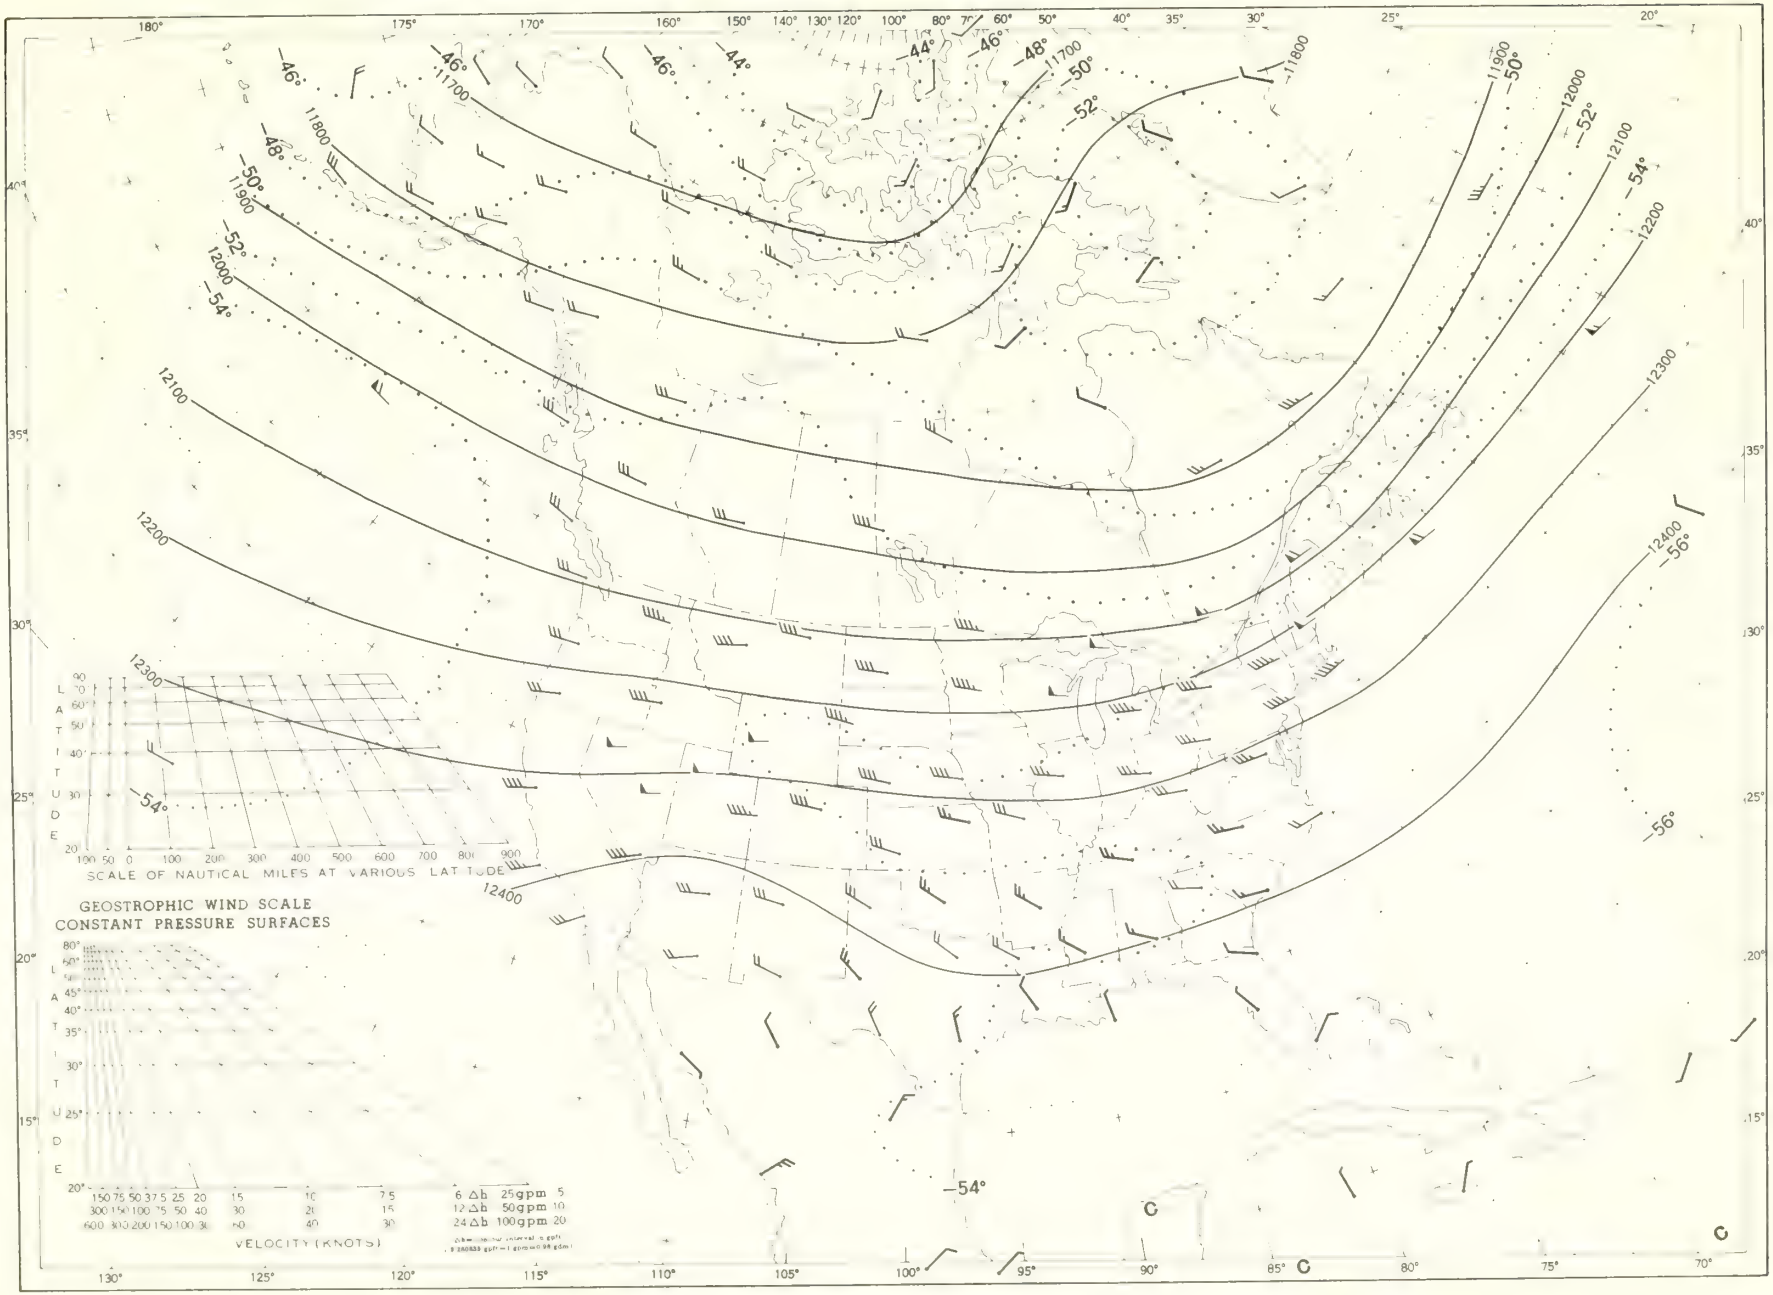
See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, August 1966. Average Height and Temperature, and Resultant Winds.



See Chart XI for explanation of map.

Chart XV. 200-mb. Surface, 1200 GMT, August 1966. Average Height and Temperature, and Resultant Winds.



See Chart XI for explanation of map.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 9 SEPTEMBER 1966

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Unusually warm in Northern Rockies.
2. Heavy precipitation in Northeast Drought areas.
3. Tornado Southeast Cleveland, Ohio, 29th.

TEMPERATURE.--September temperatures averaged above normal along the Canadian Border west of the Great Lakes and in the Far West, and below normal in most other areas. This temperature pattern was just the reverse of that for September 1965 which was warm in the South and East and unusually cold in north-central and western areas. This was the coolest September since 1957 at Oklahoma City, Okla., and the warmest during a record dating back to 1896 at Kalispell, Mont. Extreme temperatures for the month ranged from 114° at Indio, Calif., to 13° at Sula, Mont., and two stations in California.

The warm weather in most of the Far West was continuous except for brief cool spells at the beginning of the month and again during the third week. In Montana and adjacent areas, the second week was 12° warmer than normal. Red Bluff, Calif., recorded a record high temperature for so late in the season of 109° on the 29th and Sacramento, Calif., one of 103° on the 30th. Highs in the 90's occurred on several days in the northwestern Great Plains.

Relatively warm weather persisted east of the Appalachians from Maryland and Delaware northeastward through New England the first 13 days of the month. Temperatures were well below normal during the remainder of the month in this region as well as in other areas east of the Rockies.

PRECIPITATION. -- The precipitation pattern for September, relative to normal, was extremely irregular with monthly totals ranging from none at all to more than twice normal. Some of the greatest monthly totals included 11.48 inches at Heflin, Ala., 12.67 inches at Emmitsburg, Md., 17.66 inches at Wewahitchka, Fla., and 13.77 inches at Red Bluff Crossing, Tex. Unofficial readings up to 17 inches or more were reported in Texas.

The largest and most important area of heavy rainfall extended from northern Georgia northeastward through Maryland, Delaware, New Jersey, eastern Pennsylvania, eastern New York, and southern New England. Nearly all this area received over 4 inches and numerous stations reported 6 to over 8 inches. Up to 5 years of drought had persisted from the Virginias northeastward to eastern New York and southern New England. These heavy rains helped replenish soil moisture, and eased water shortages in streams, lakes and reservoirs. Harrisburg, Pa., measured 6.12 inches for its largest monthly total since July 1961 and the most for September in the past 32 years. Most of this heavy rainfall occurred during a storm on the 13th to 15th when the Washington, D. C. Airport, measured 4.15 inches in 24 hours. Heavy rains over the Potomac River Basin ended the threat of a water shortage in the Nation's Capital. In north-central Maryland rainfall for this September was the heaviest since 1934.

Other areas with well above normal rainfall included parts of the Ohio Valley, the Great Plains, southern Rockies, Pacific Northwest, and Gulf Coastal areas. This was the third consecutive month of above-normal rainfall in the northern Great Plains. Wichita Falls, Tex., had 7.45 inches, the most for September since 1936 and Rapid City, S. Dak., measured 2.13 inches on the 13th for the greatest 24-hour amount there in September since 1923. In the Far West 1.88 inches at Medford, Oreg., was the greatest September total there since 1940, and 2.00 inches was the greatest September amount for Phoenix, Ariz., since 1958.

The area with most serious deficiencies extended from southern Idaho southwestward through California. Ranges were in poor condition throughout this area and in Nevada cattle and sheep were down from the high ranges a week to a month early due to lack of forage. In some areas grain seeding was delayed. At Eureka, Calif., rain on the 17th and 18th, the first substantial rain of the season, was helpful, but hot, dry weather the last 10 days of the month caused a very high fire hazzard in nearby forests by the end of the month. At Red Bluff, Calif., drought which began in March 1966 continued. San Diego, Calif., had only a trace for the period July through September. Boise, Idaho, reported its driest water year (October 1, 1965-September 30, 1966), 5.74 inches; the second driest was the 1923-24 year with 7.36 inches. Drought continued in western Nevada where Reno had only 0.10 inch of rain for the month, less than half normal, and only 0.73 inch since January 1, less than 15 percent of normal for the period.

SEVERE STORMS.--The usual severe local storms occurred during the passage of fronts and low pressure areas. A tornado injured more than a score of people and caused considerable damage in the southeastern suburbs of Cleveland, Ohio, on the 29th. Flashflooding caused damage in many areas. Flooding in the Metropolitan area of Washington, D. C., on the 14th was blamed for one death and damage estimated up to $2 million.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

°	Includes crop damage
C	Crop damage
R	Rain
T	Thunderstorms and heavy rain

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
∅ For breakdown of "All Others", and for detailed listing of other storms, see the U. S. Weather Bureau monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5,000,000
7	$5,000,000 to $50,000,000
8	$50,000,000 to $500,000,000
9	$500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

SEPTEMBER 1966

Elmer R. Nelson, Office of Hydrology

The most significant flooding was in the Rio Grande Basin with heavy damages to crops and some damages to levees, dams, and highways. Total damages were estimated at over $500,000.

Severe flash flooding was reported on some small streams in New Jersey. Flooding reported elsewhere in the Country was mostly minor.

ATLANTIC SLOPE DRAINAGE

Minor flooding occurred on Assunpink Creek at Trenton, N. J., on the 21st and 22d. This overflow was due to heavy rainfall over central and northern New Jersey on the 20th and 21st. Over 7 inches of rain was recorded in some areas. Even though record drought had continued into mid-September, the heavy rainfall (2 to 3 inches) on the 14th and 15th created excessive soil moisture in some areas. However, much of the potential runoff became absorbed. There was no flood damage of significance on larger streams. Severe flash flooding was reported on some small streams. The Elizabeth River at Elizabeth, N. J., (drainage area 20.2 sq. mi.) reached its highest peak in 45 years of record. The city of Elizabeth was declared a disaster area.

MISSISSIPPI SYSTEM

Missouri Basin.--The only threat of flooding in the Missouri Basin during September was due to heavy rains within a 50-mile arc to the west and northwest of Sioux Falls, S. Dak.

Heavy rains (3 to 4 inches) during the evening of September 1 caused the West Fork of the Vermillion River to rise to near bankful stage during the evening. Severe thunderstorms with heavy rain during the afternoon and evening of the 10th caused some surface flooding in southwestern Sioux Falls and in scattered localities between Sioux Falls and Madison. Heavy rains caused washouts to fields and roads a few miles south of Madison. Rivers remained within banks and there was no damage due to overflow from rivers.

Arkansas Basin.--Heavy rain (6.41 inches) on the 3d, centered at Hominy, Okla., caused Hominy Creek at Skiatook, Okla., to crest at a stage of 30.4 feet, 14.4 feet above flood stage. Local light to moderate flooding occurred in southeast Tulsa, Okla. The heaviest rains occurred in the Joe and Mingo Creek Basins, where unofficial amounts of 4 to 6 inches were reported.

Lower Mississippi Basin.--Heavy rains during the afternoon and evening of the 18th resulted in some flash flooding of small streams in Shelby and Tipton Counties in western Tennessee. Almost 3 inches of rain occurred at Millington, Tenn., in a 90-minute period. Up to 7 inches of rain was reported from the Indian Creek area near Brighton, Tenn. A total of 3.36 inches of rain was recorded in 6-1/2 hours at Covington. The heaviest rainfall reported from an official weather gage was 7.15 inches at New Madrid, Mo., along the Mississippi River.

The heavy rains in the Indian Creek basin in southern Tipton County caused the creek to overflow its banks in the evening of the 18th. Several families were evacuated from their homes. Several head of livestock were drowned. The water began to recede about 10 p.m., but not until at least one car had to be abandoned on Highway 51. Cars in low-lying areas near Brighton, Tenn., were reported completely covered with water.

WEST GULF OF MEXICO DRAINAGE

Heavy rains on the 6th followed by additional heavy rains on the 8th and 9th caused minor flooding on the lower Frio River in Texas. The rains on the 6th ranged from 3 to 5 inches over an area about 20 miles wide extending from Catarina to Pleasanton. Locally heavy rains up to 2 inches occurred on the 8th and 9th. No damages were reported from the flooding.

The Rio Grande River at Presidio, Tex., went out of its banks on August 24 and continued in flood until September 20. Several crests occurred. The highest crest (18.6 ft.) occurred on August 31. This flooding was due to heavy rain over the Rio Conchos Basin in Mexico. Heavy damages resulted to crops and some damages to levees, dams, and highways.

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No 2, page 63, of this publication

RAWINSONDE REFERENCE NOTES:

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Relative humidity averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.
The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available.

Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.
These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
+ Observations for these stations are scheduled at 0000 G.C.T.
R More than half of the observations are from statistical values. Equipped with lithium chloride hygristor.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note. --Langley is the unit used to denote one gram calorie per square centimeter.
Values with an asterisk are interpolated.

U Indicates Urban sites.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. **The value represents the total incoming minus the total outgoing radiation of all wave lengths.**

* Recorder inoperative September 23-30

These data are of an experimental nature and are published as received from the Huntley Exp. Station. **The instrument with which they were measured has not been checked by the Weather Bureau.**

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

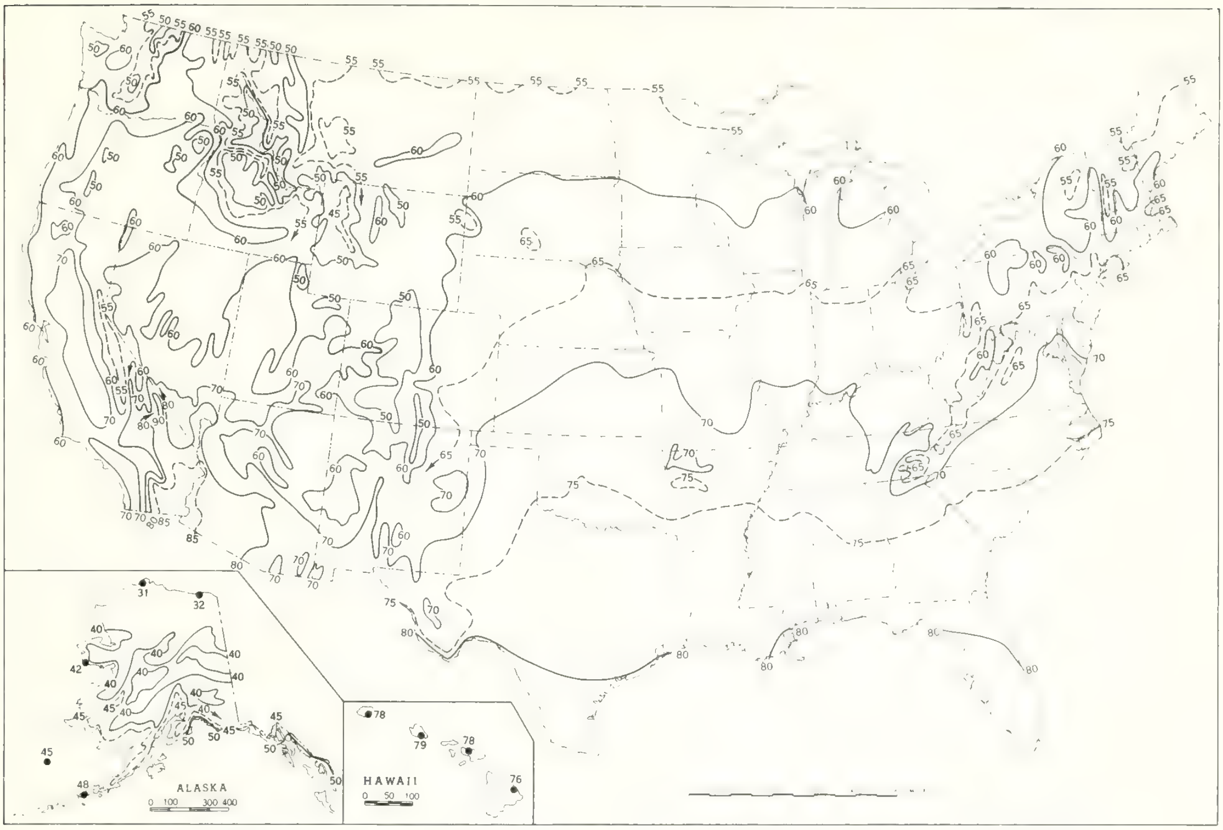
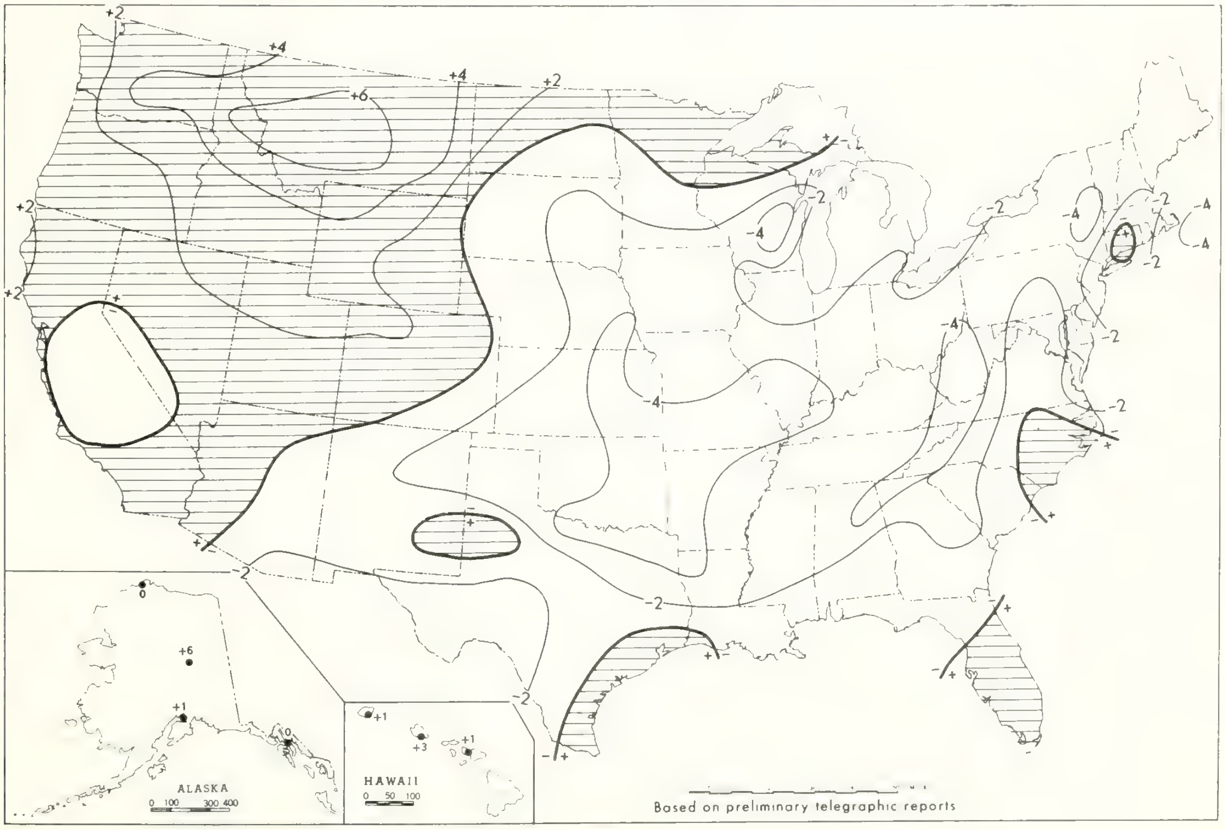
The spectrophotometer measures the total amount of ozone in the atmosphere, i e , the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g , 350 milli-atmo-cm ozone implies an ozone layer 0 350 centimeter thick The code λ s designates the type of measurement made

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), September.

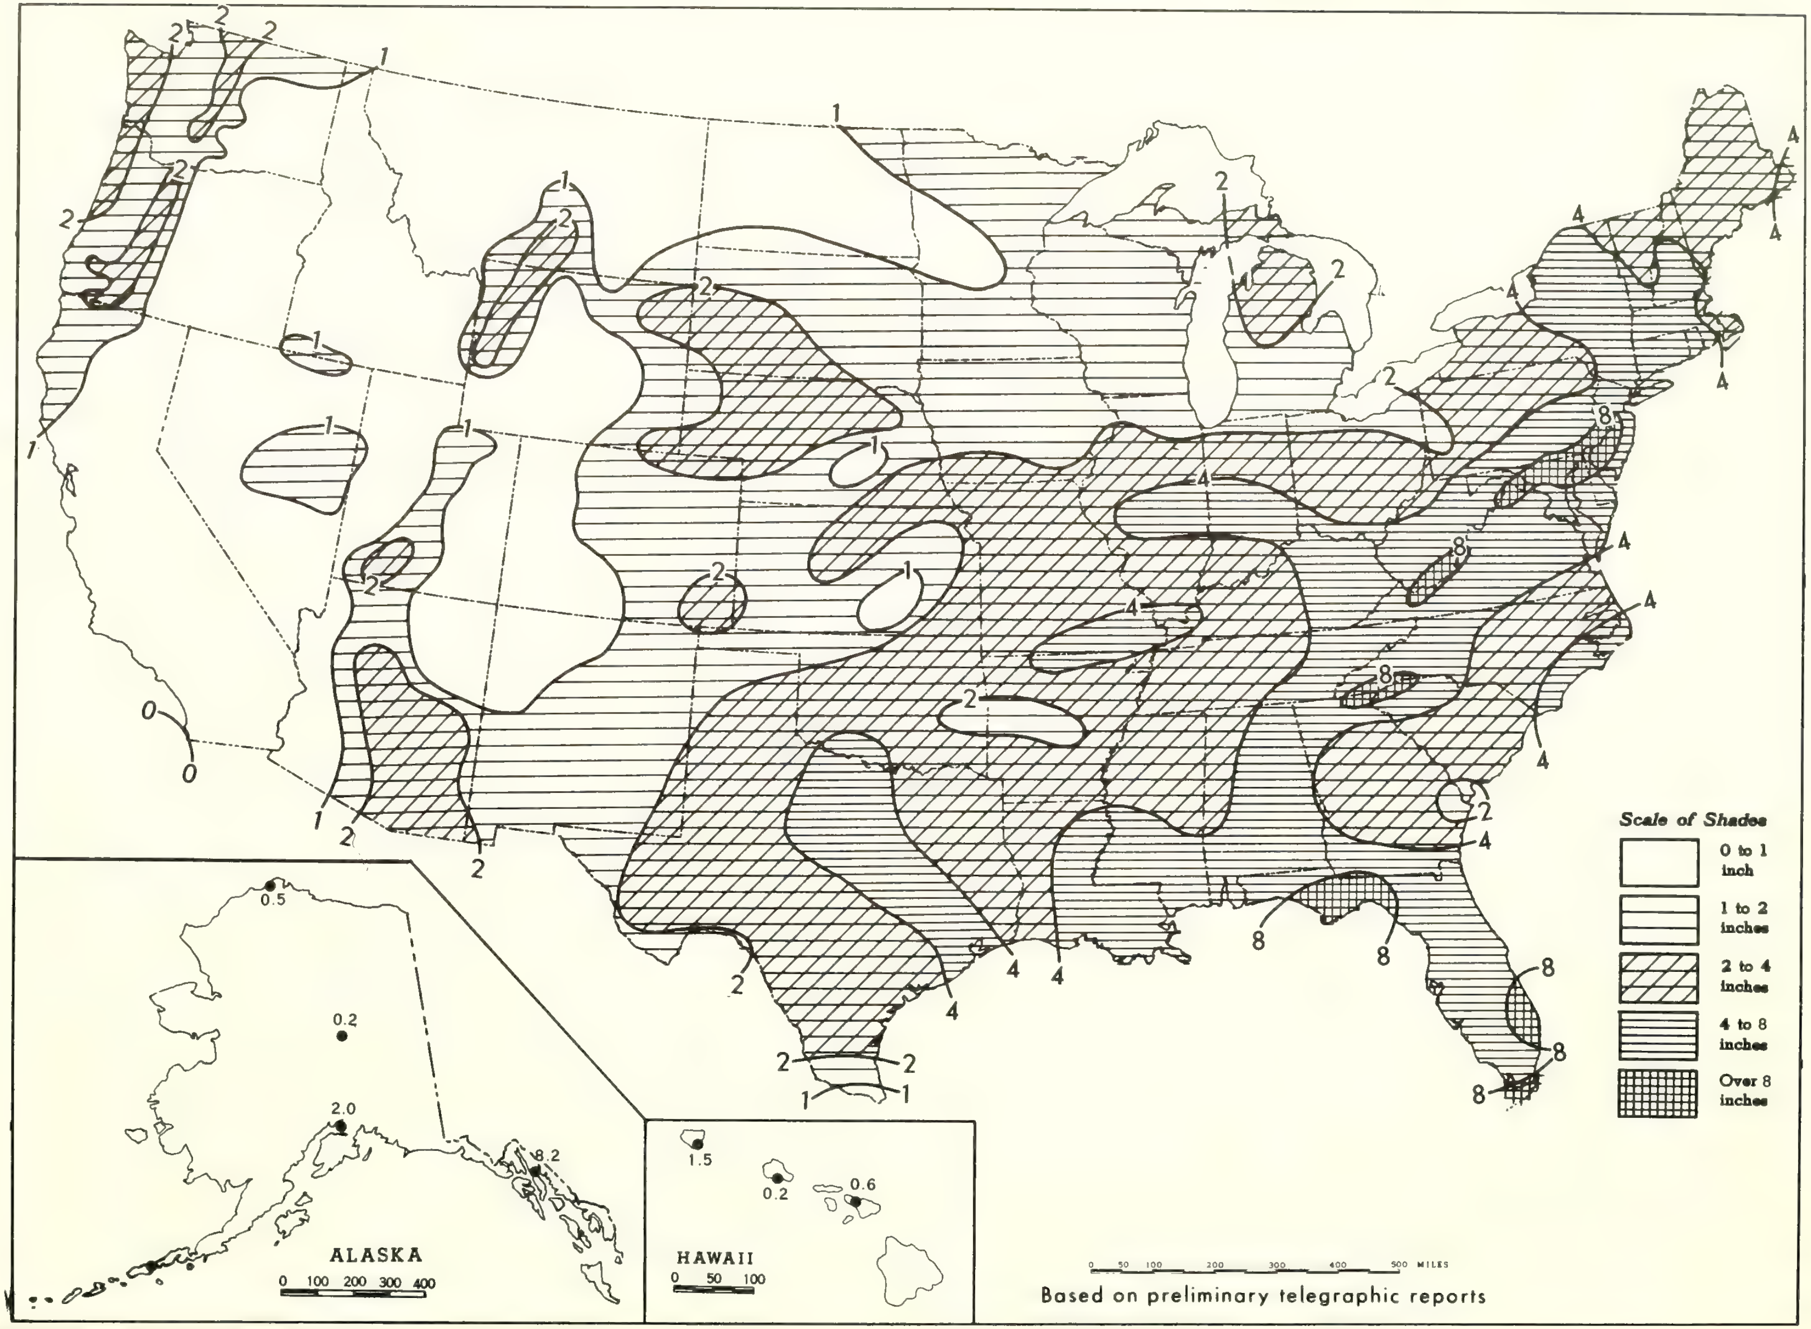


B. Temperature Departure from 30 - Year Mean (°F 1931-60), September 1966.



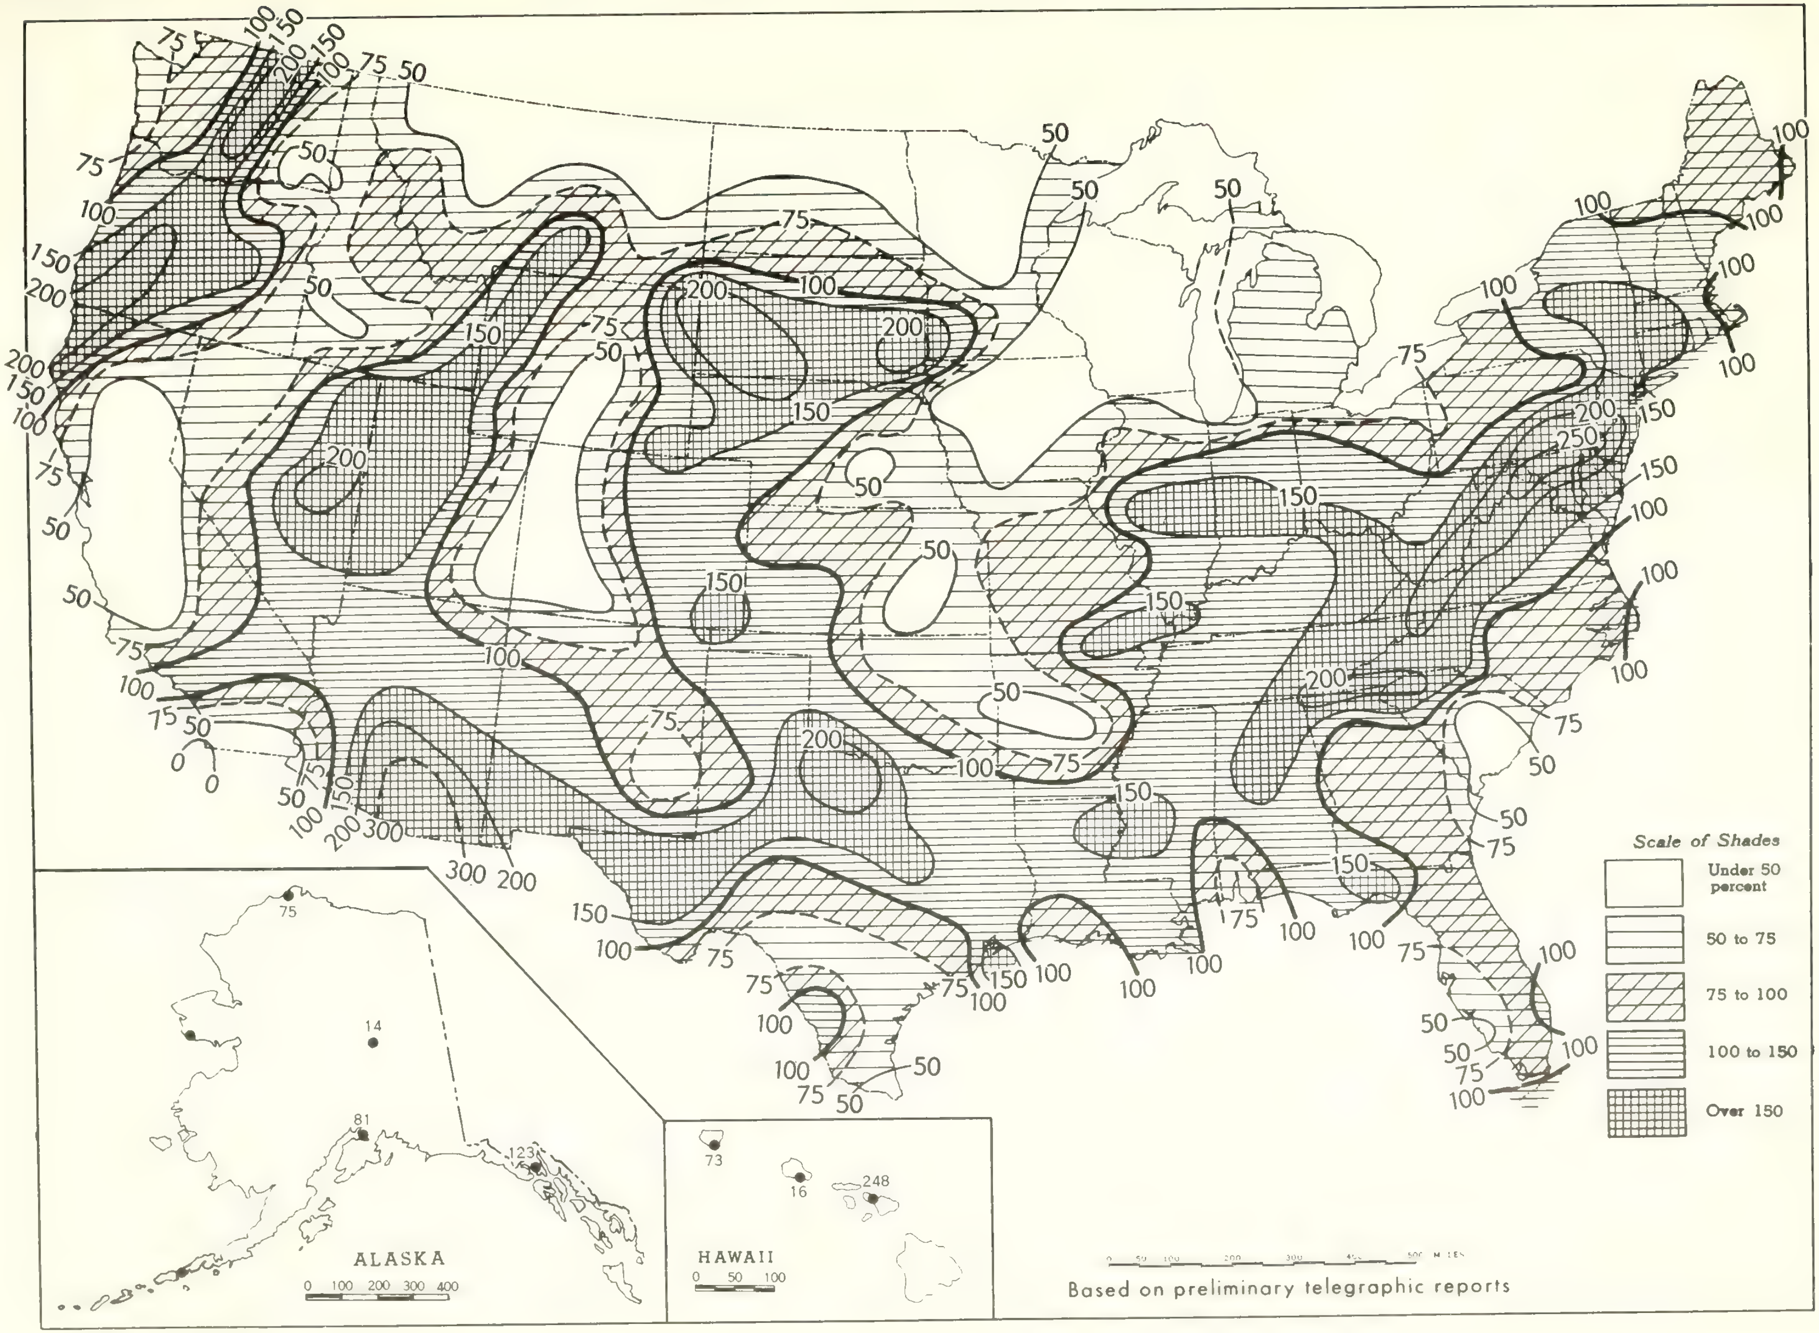
Based on preliminary telegraphic reports

Chart II. Total Precipitation (Inches), September 1966.



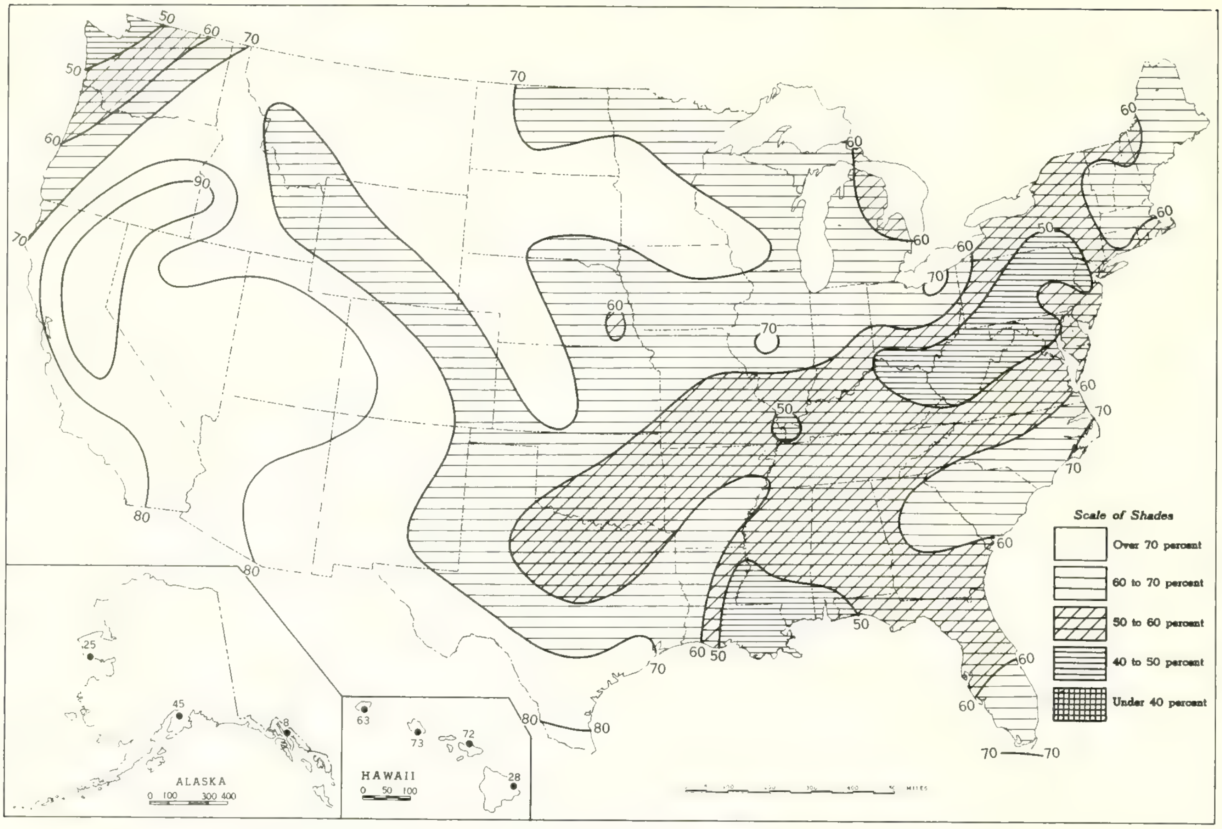
Based on preliminary telegraphic reports

Chart III. Percentage of Normal Precipitation, September 1966.

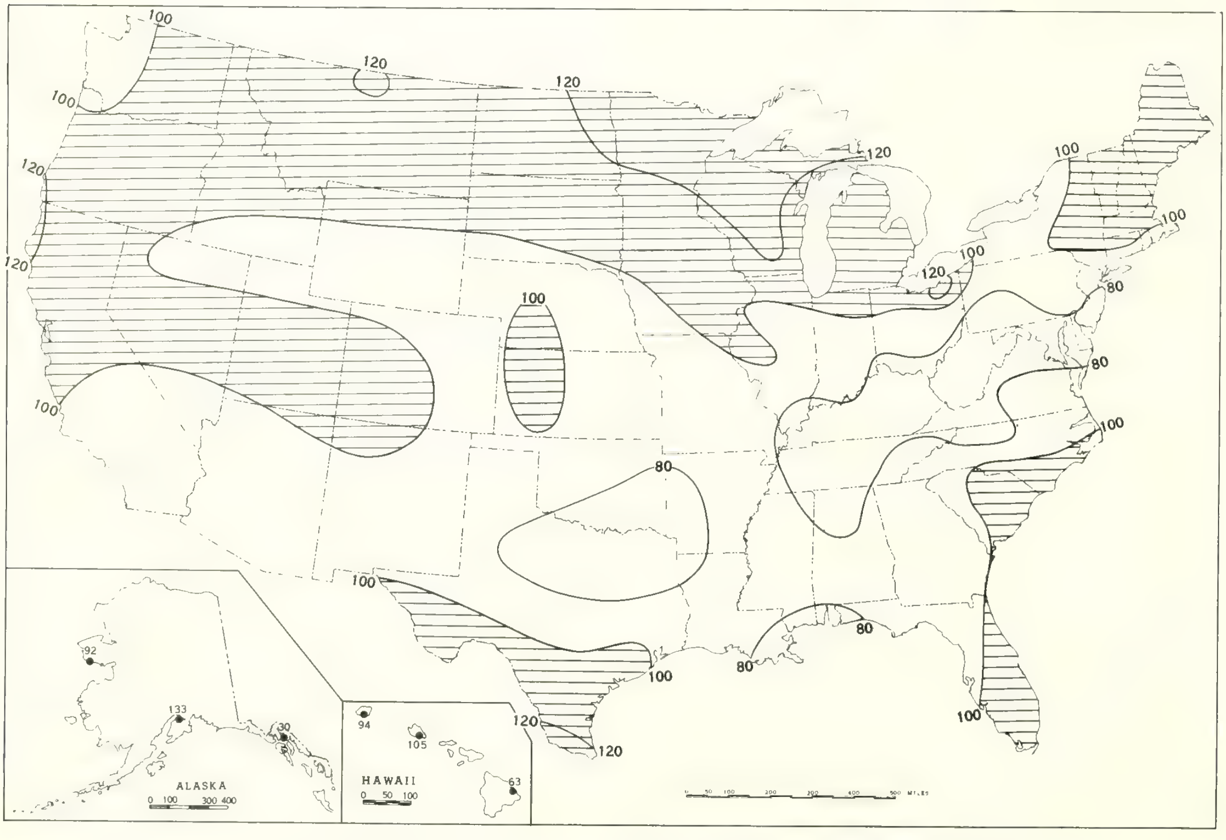


Based on preliminary telegraphic reports

Chart VI. A. Percentage of Possible Sunshine, September 1966.

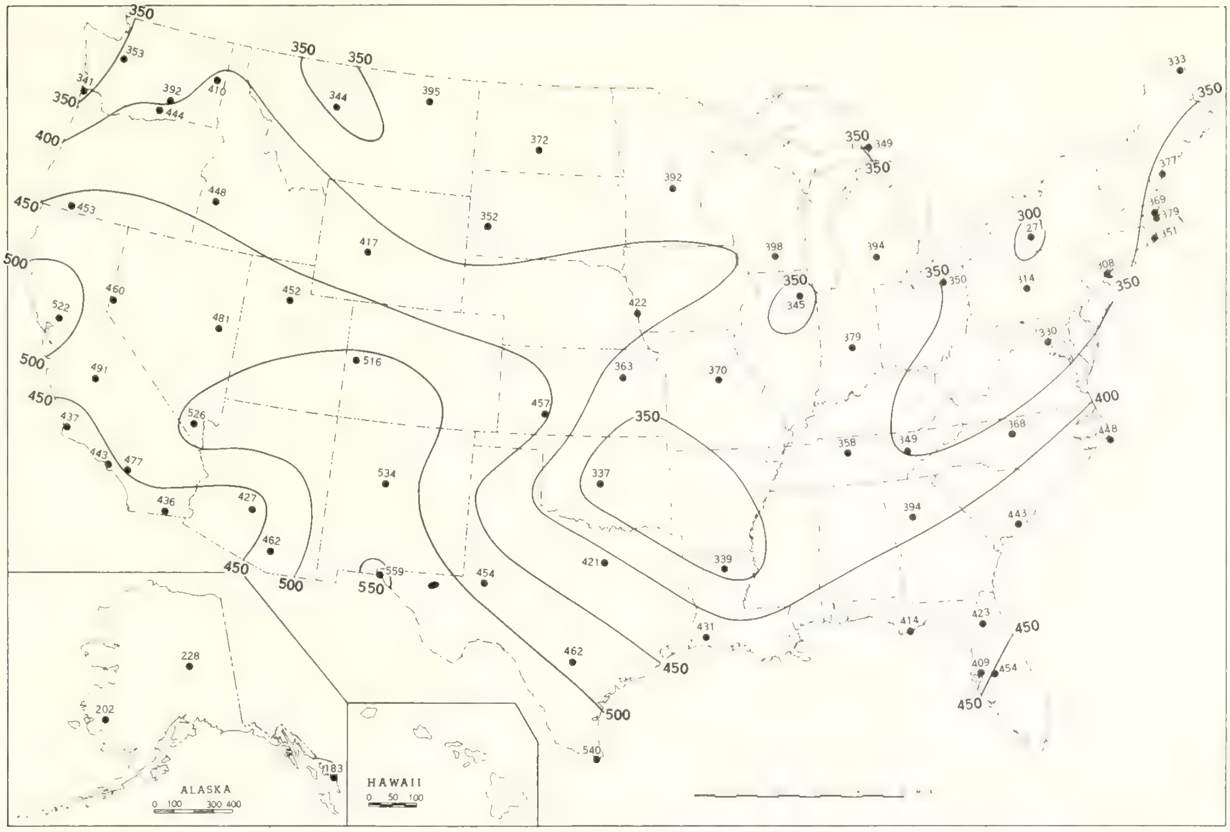


B. Percentage of Mean Monthly Sunshine, September 1966.

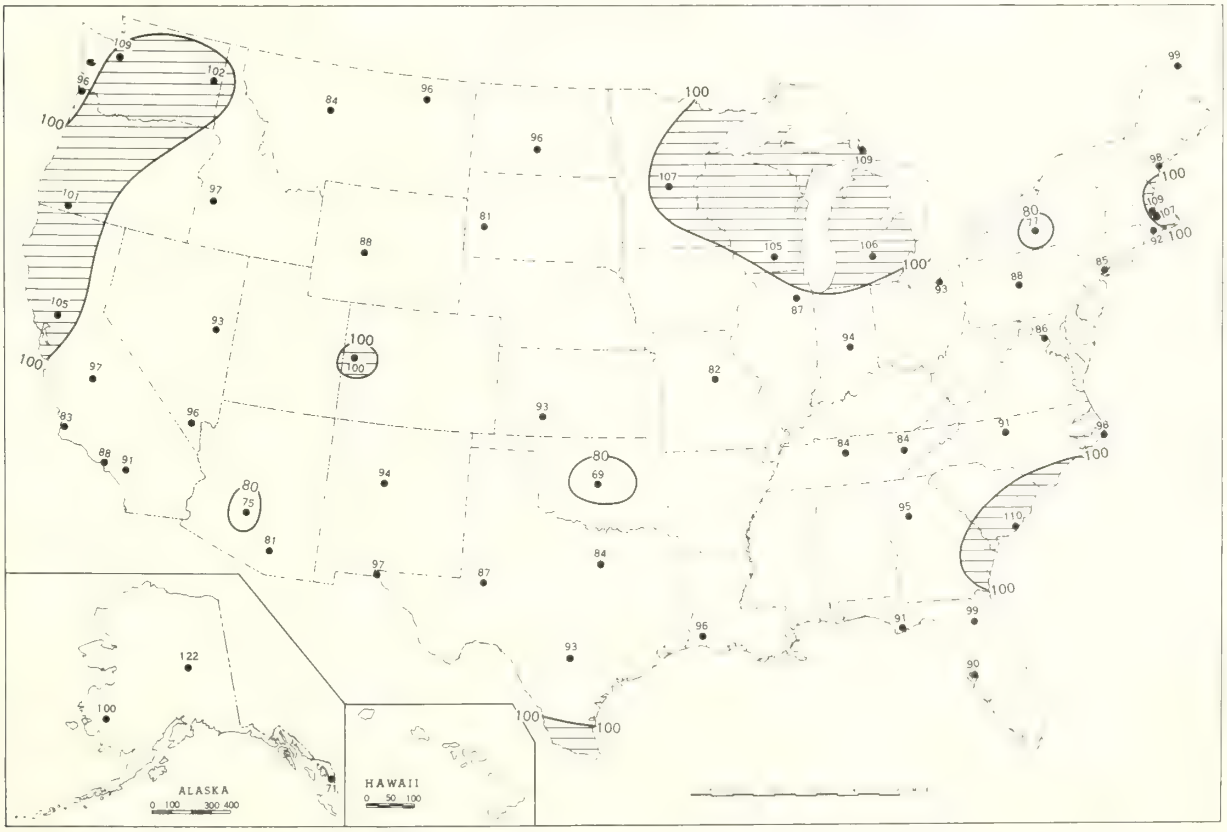


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, September 1966.

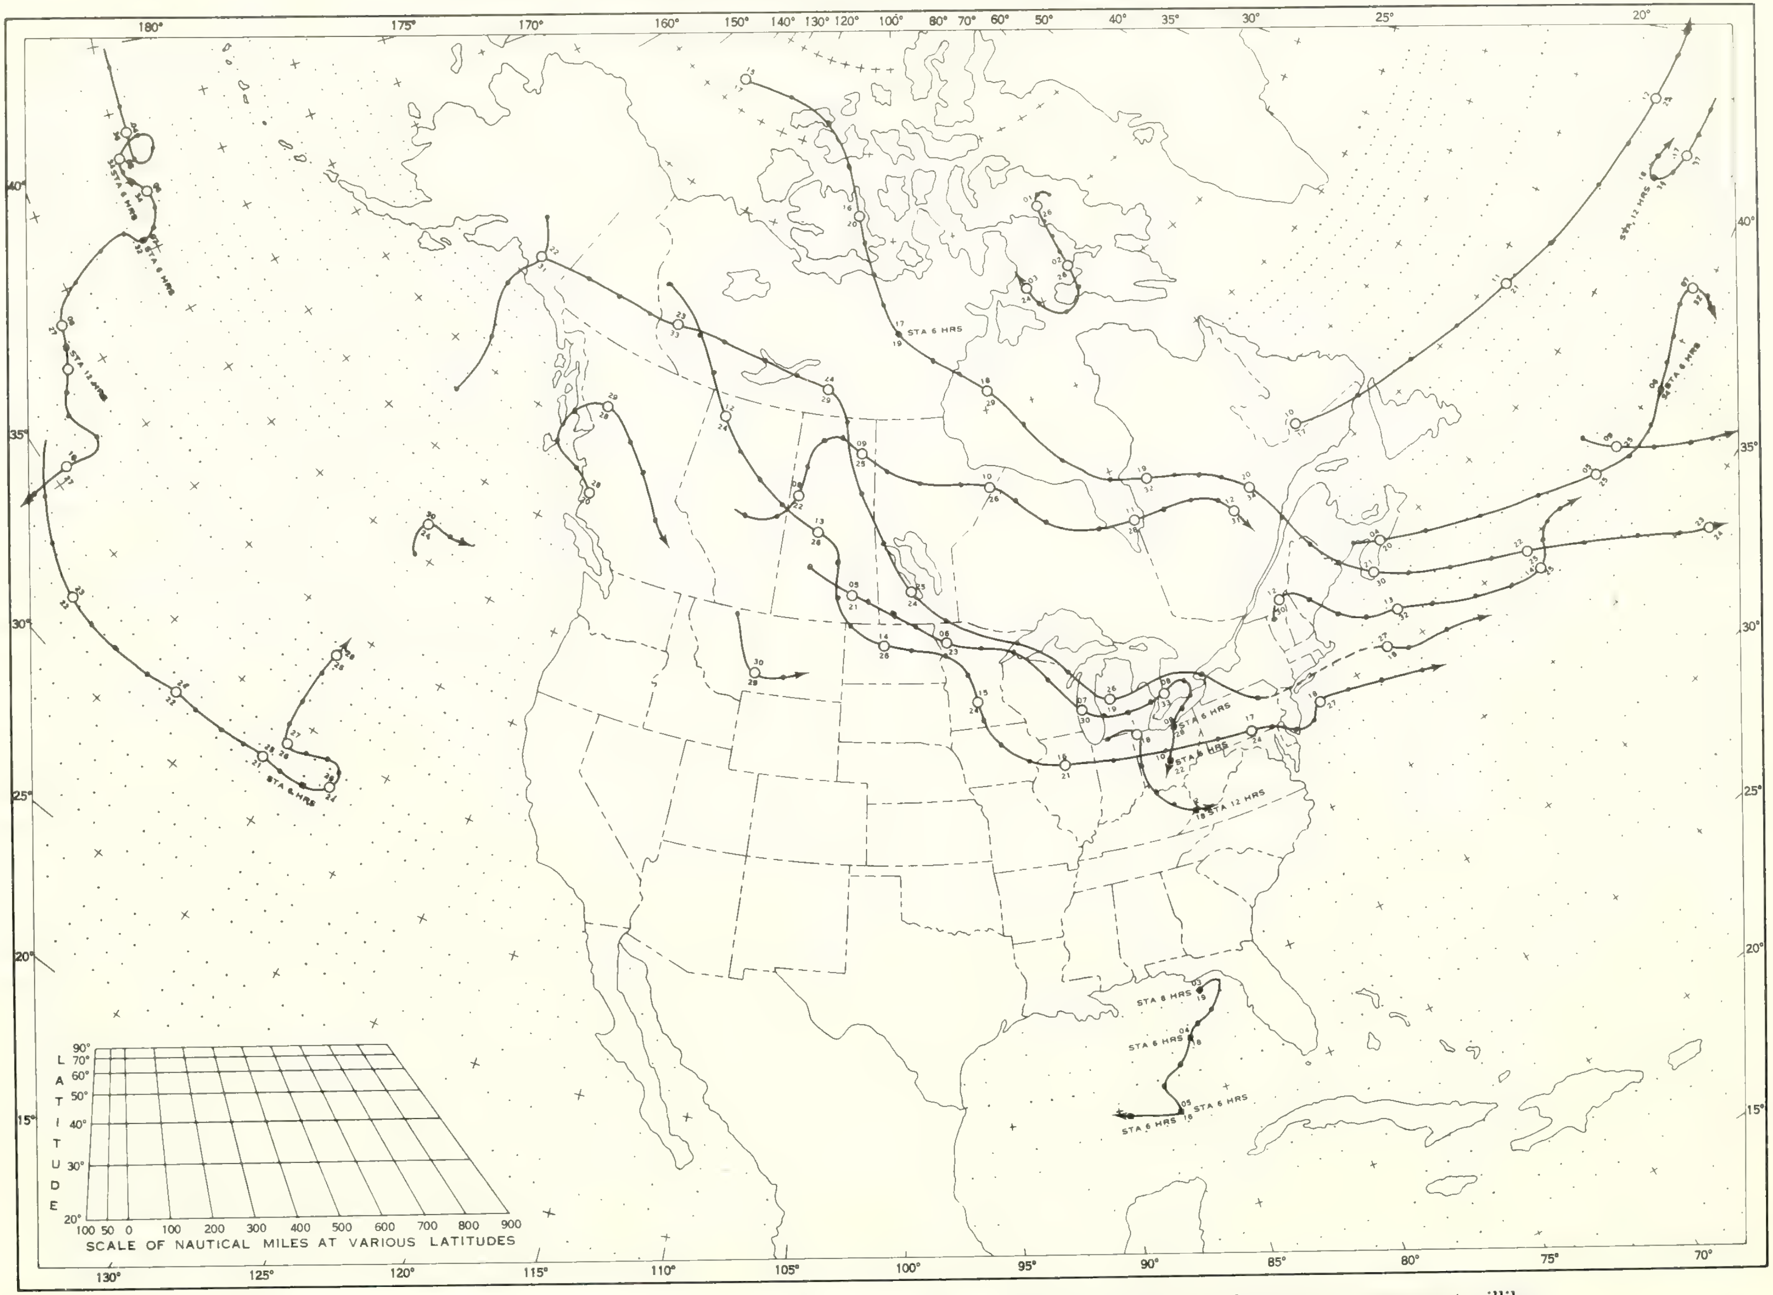


B. Percentage of Mean Daily Solar Radiation, September 1966.



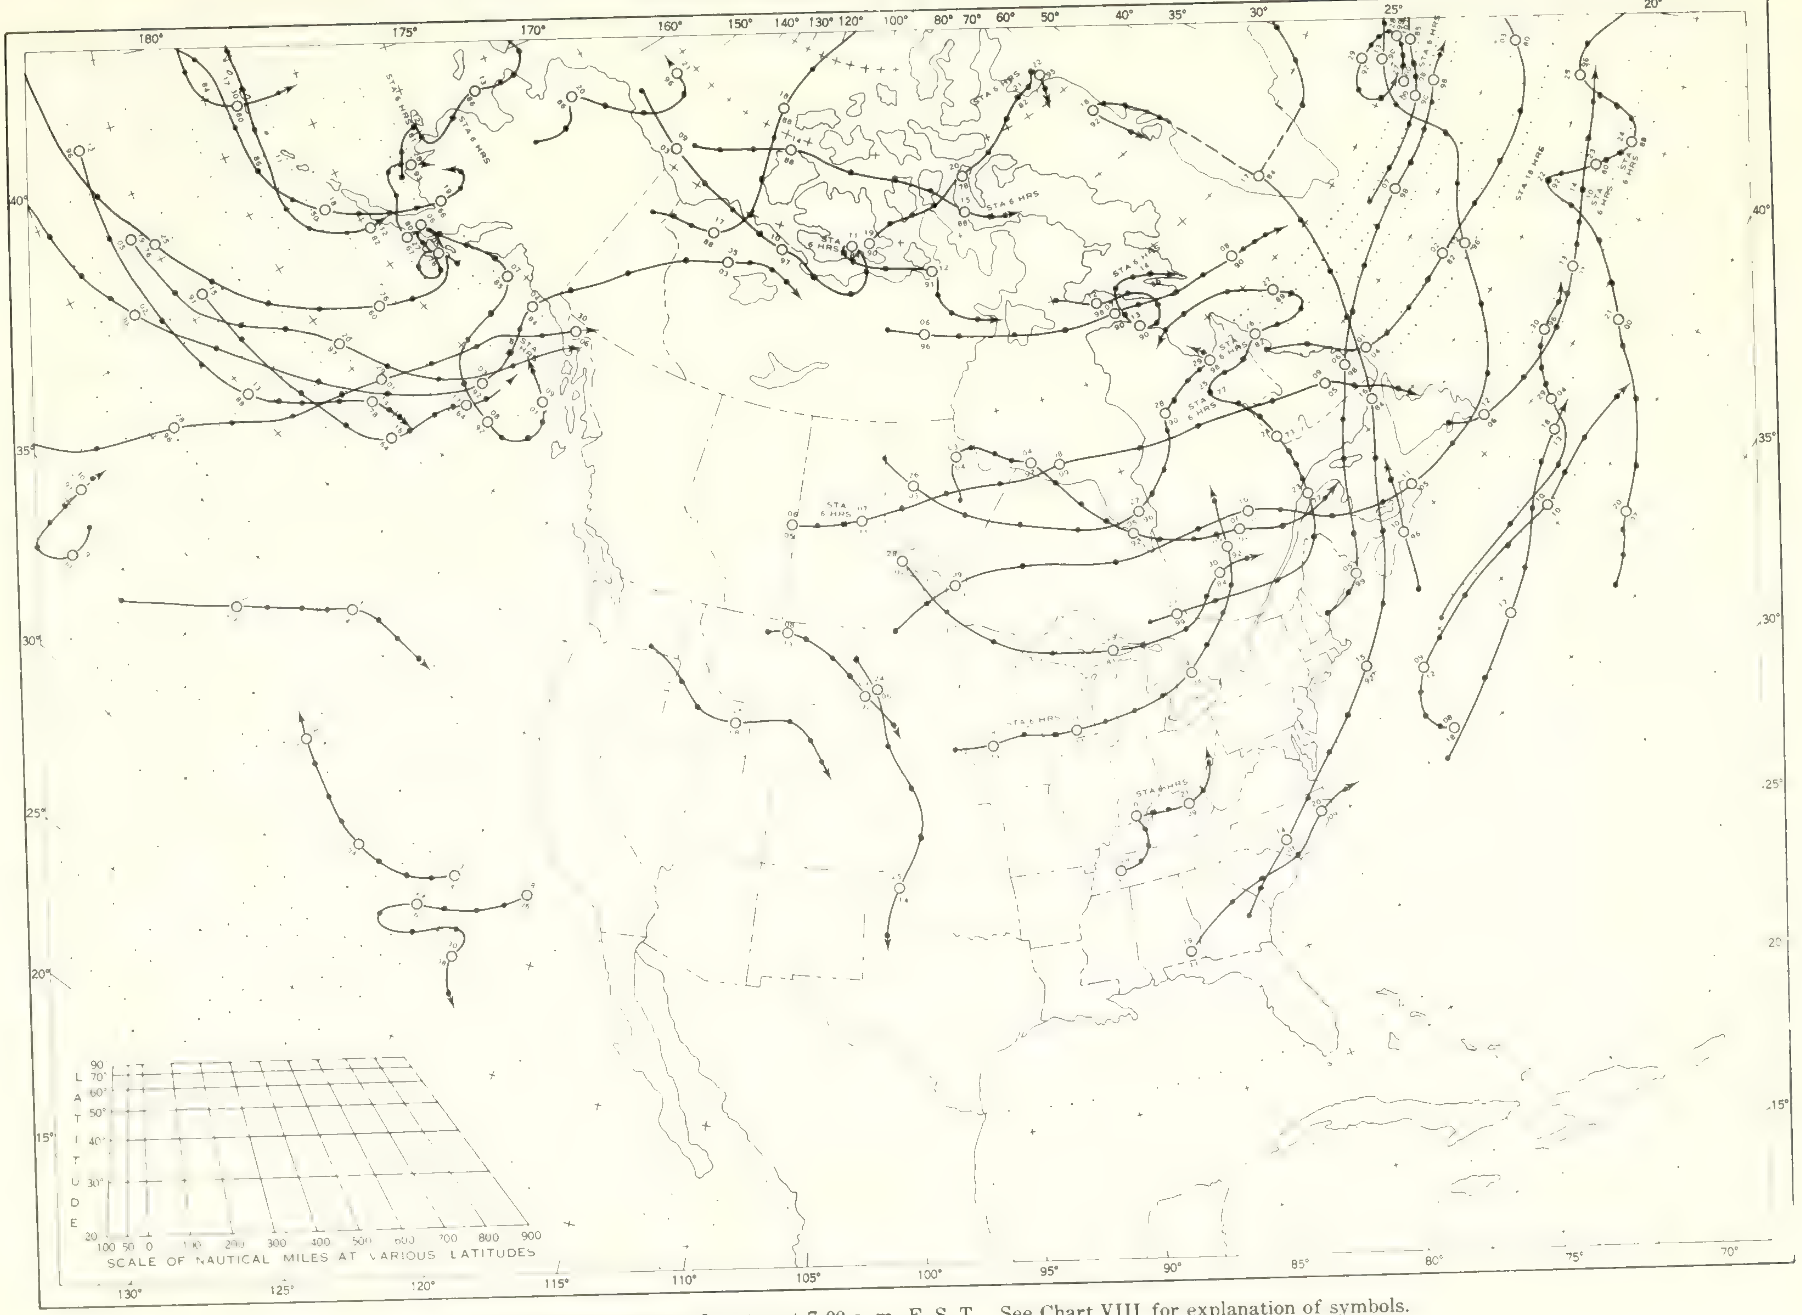
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, September 1966.



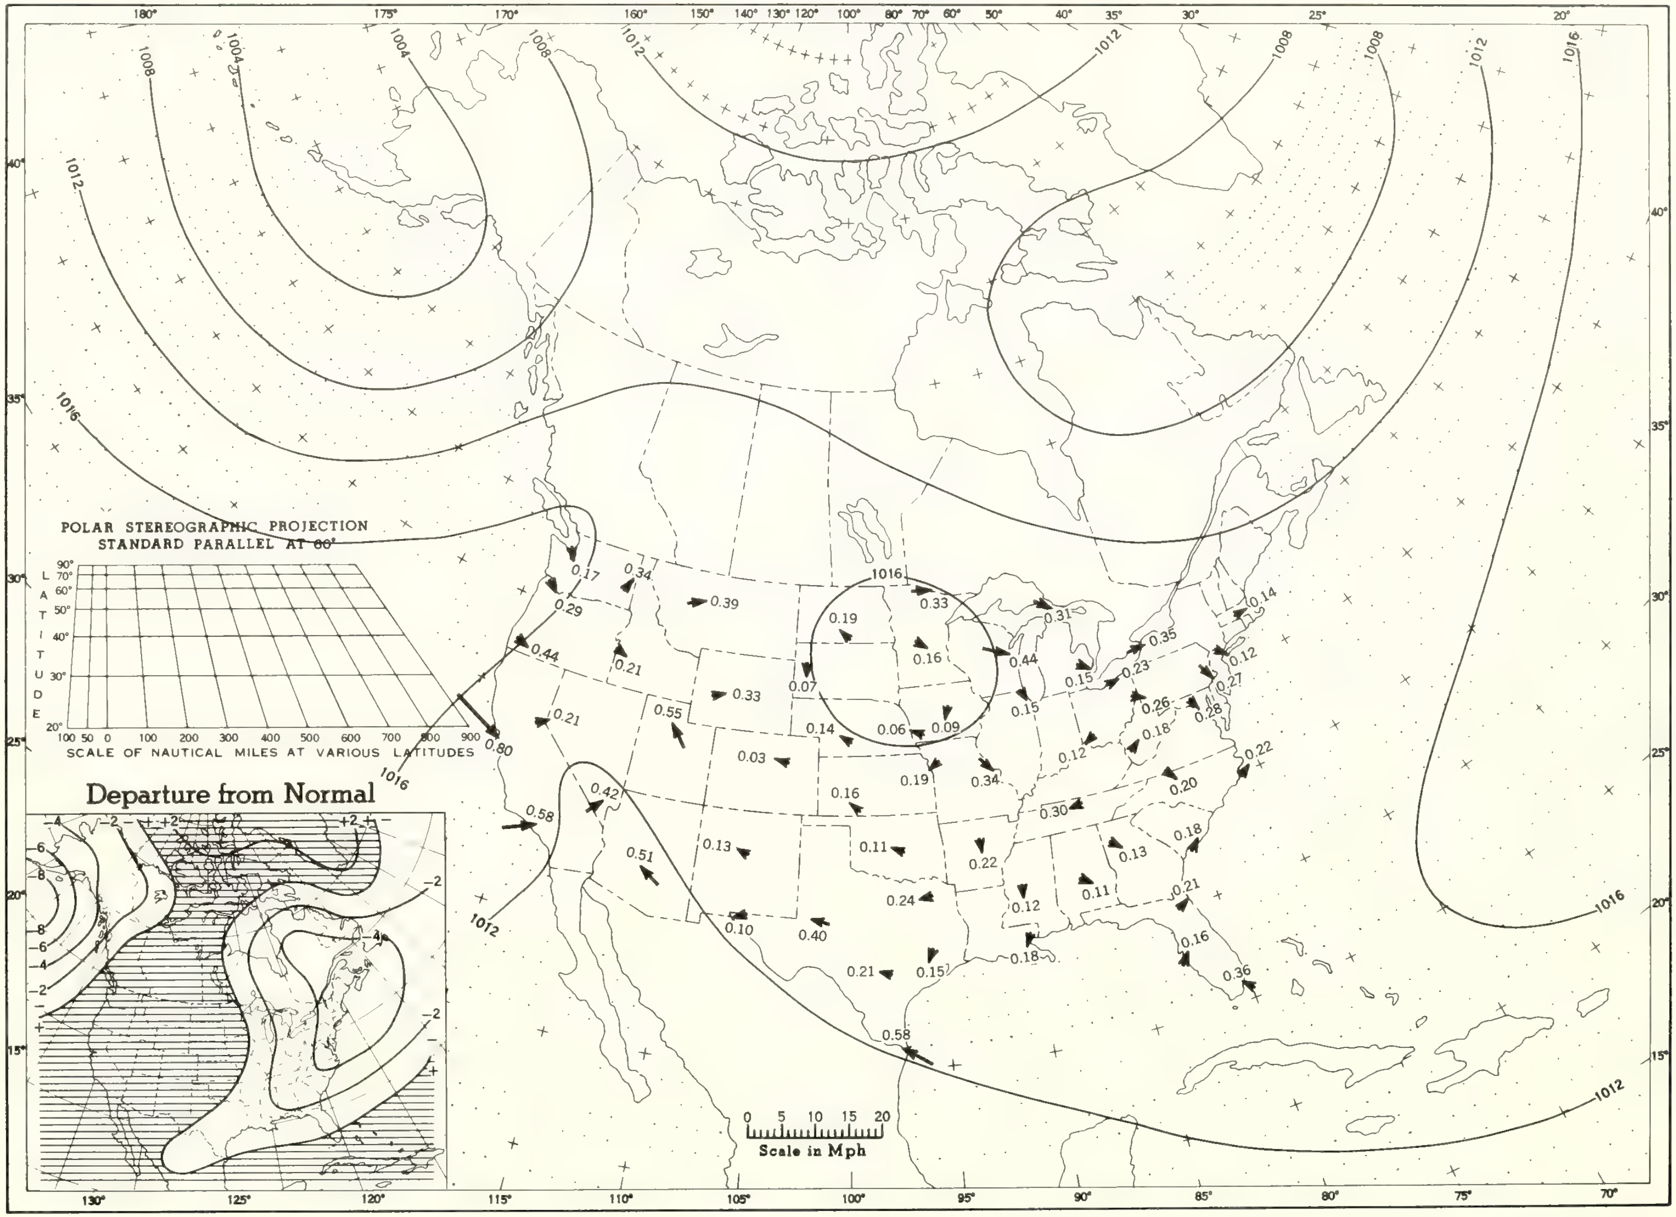
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, September 1966.



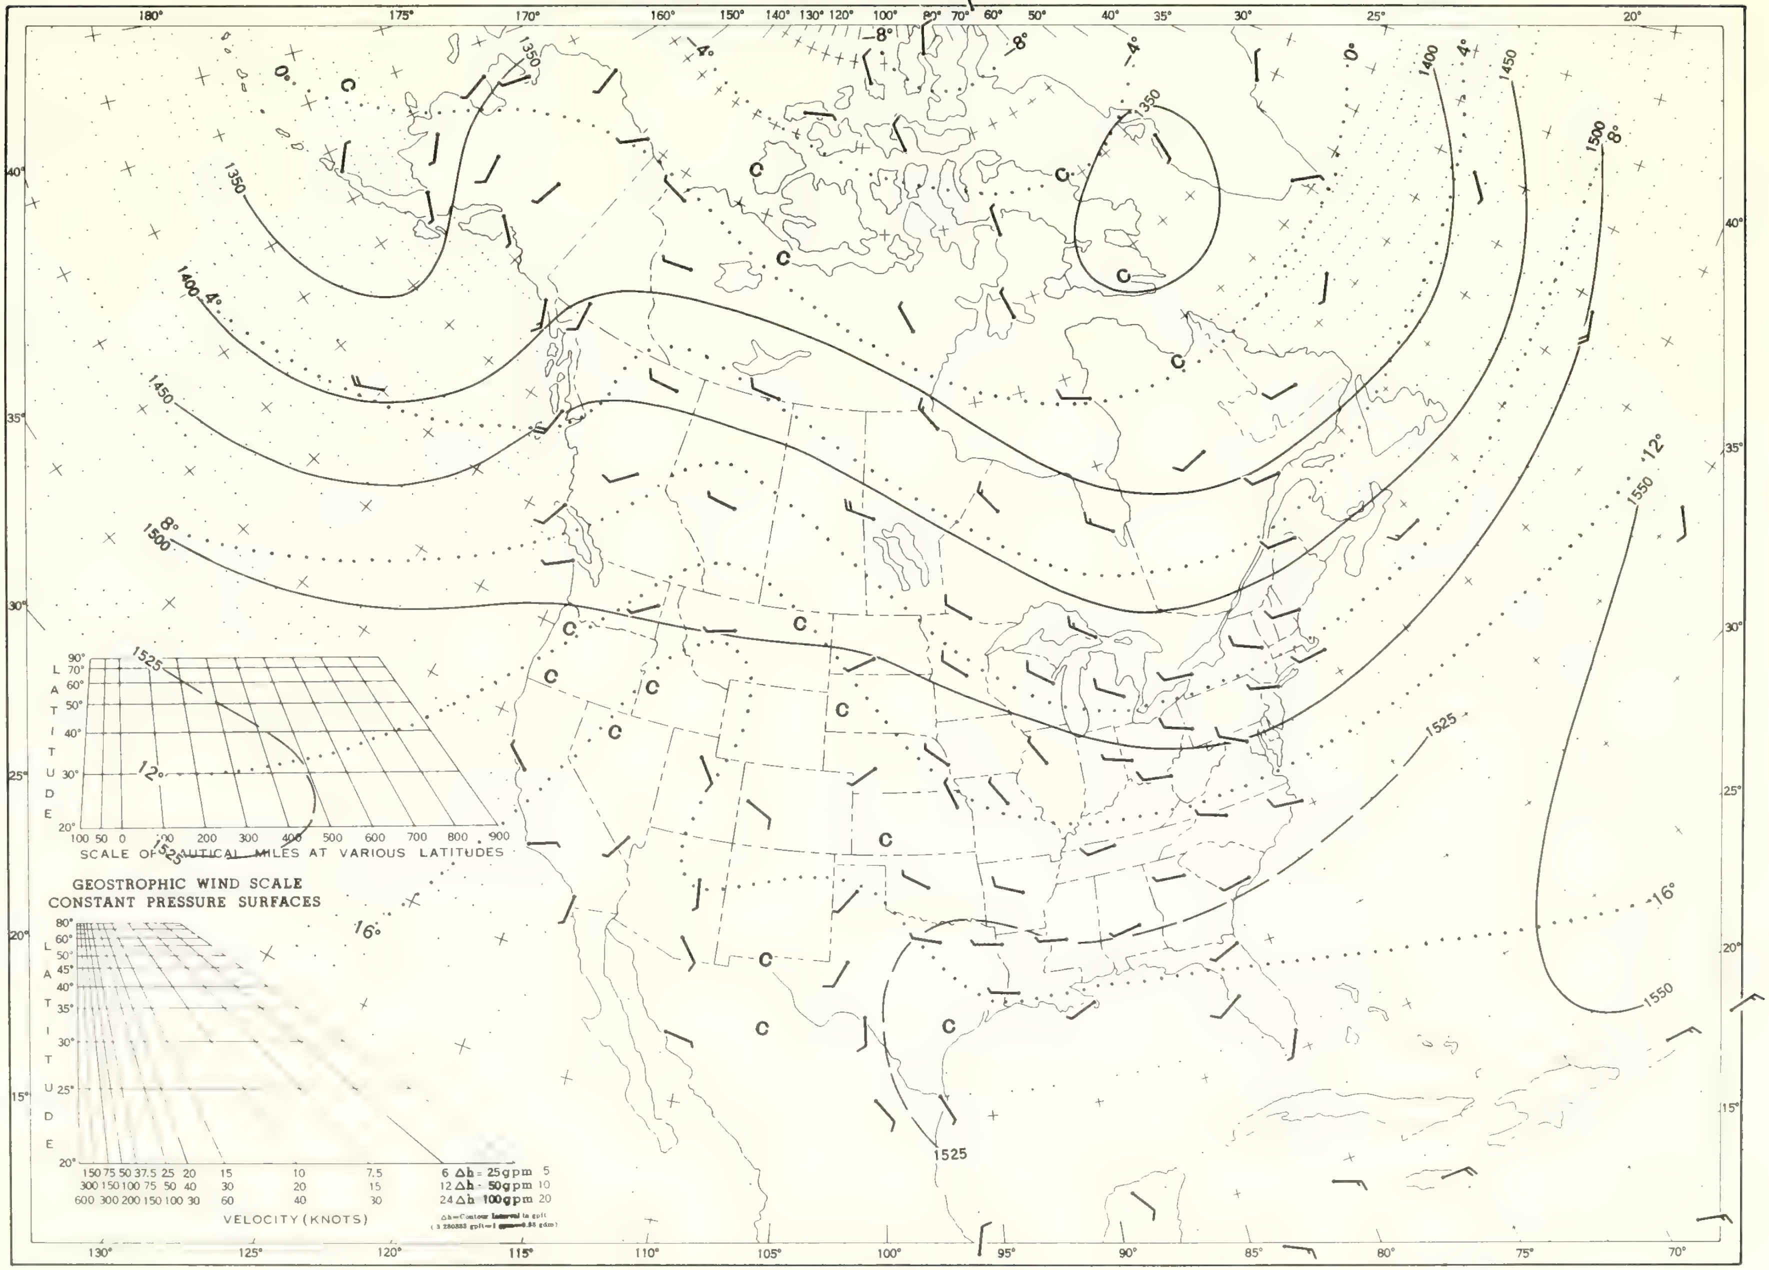
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, September 1966. Inset: Departure of Average Pressure (mb) from Normal, September 1966.



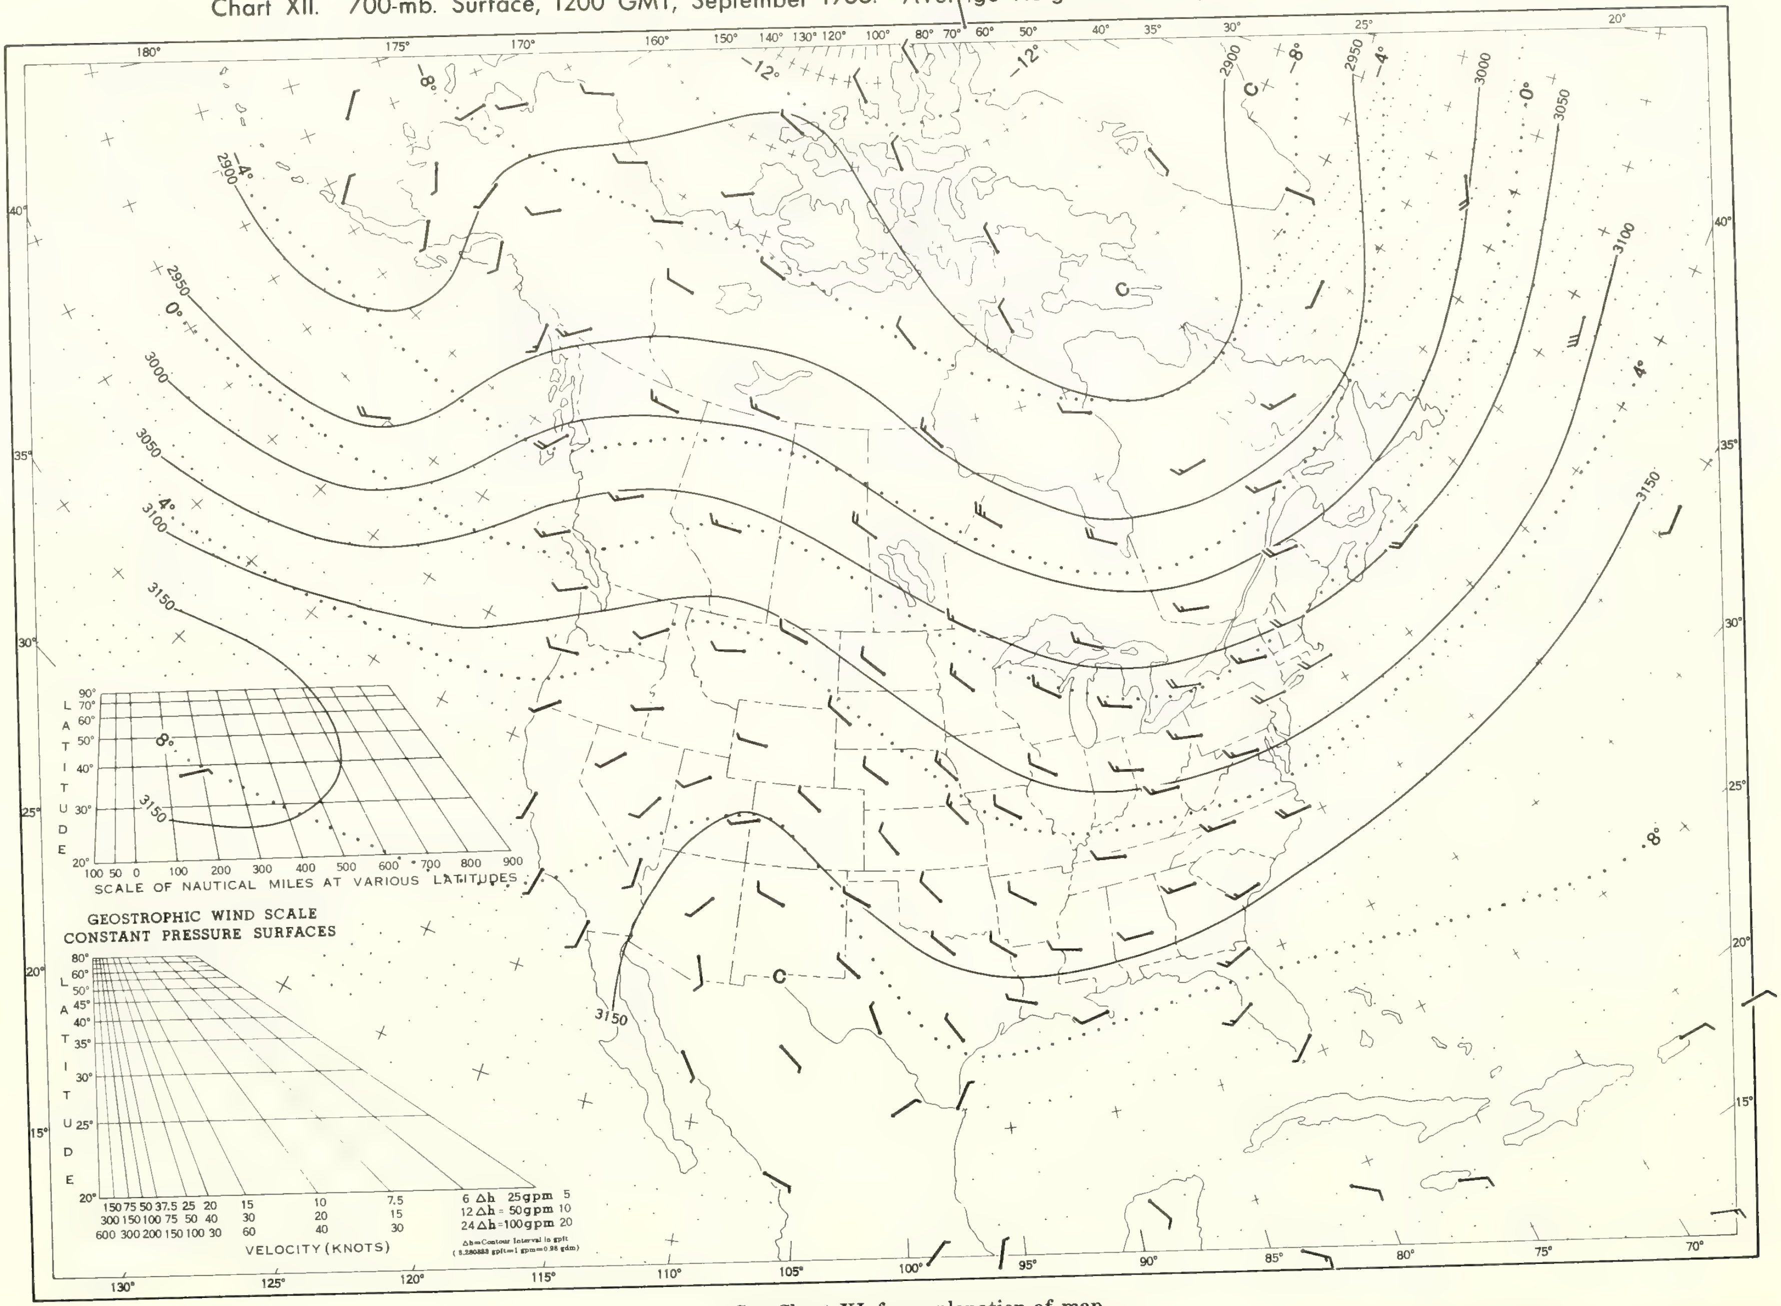
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, September 1966. Average Height and Temperature, and Resultant Winds.



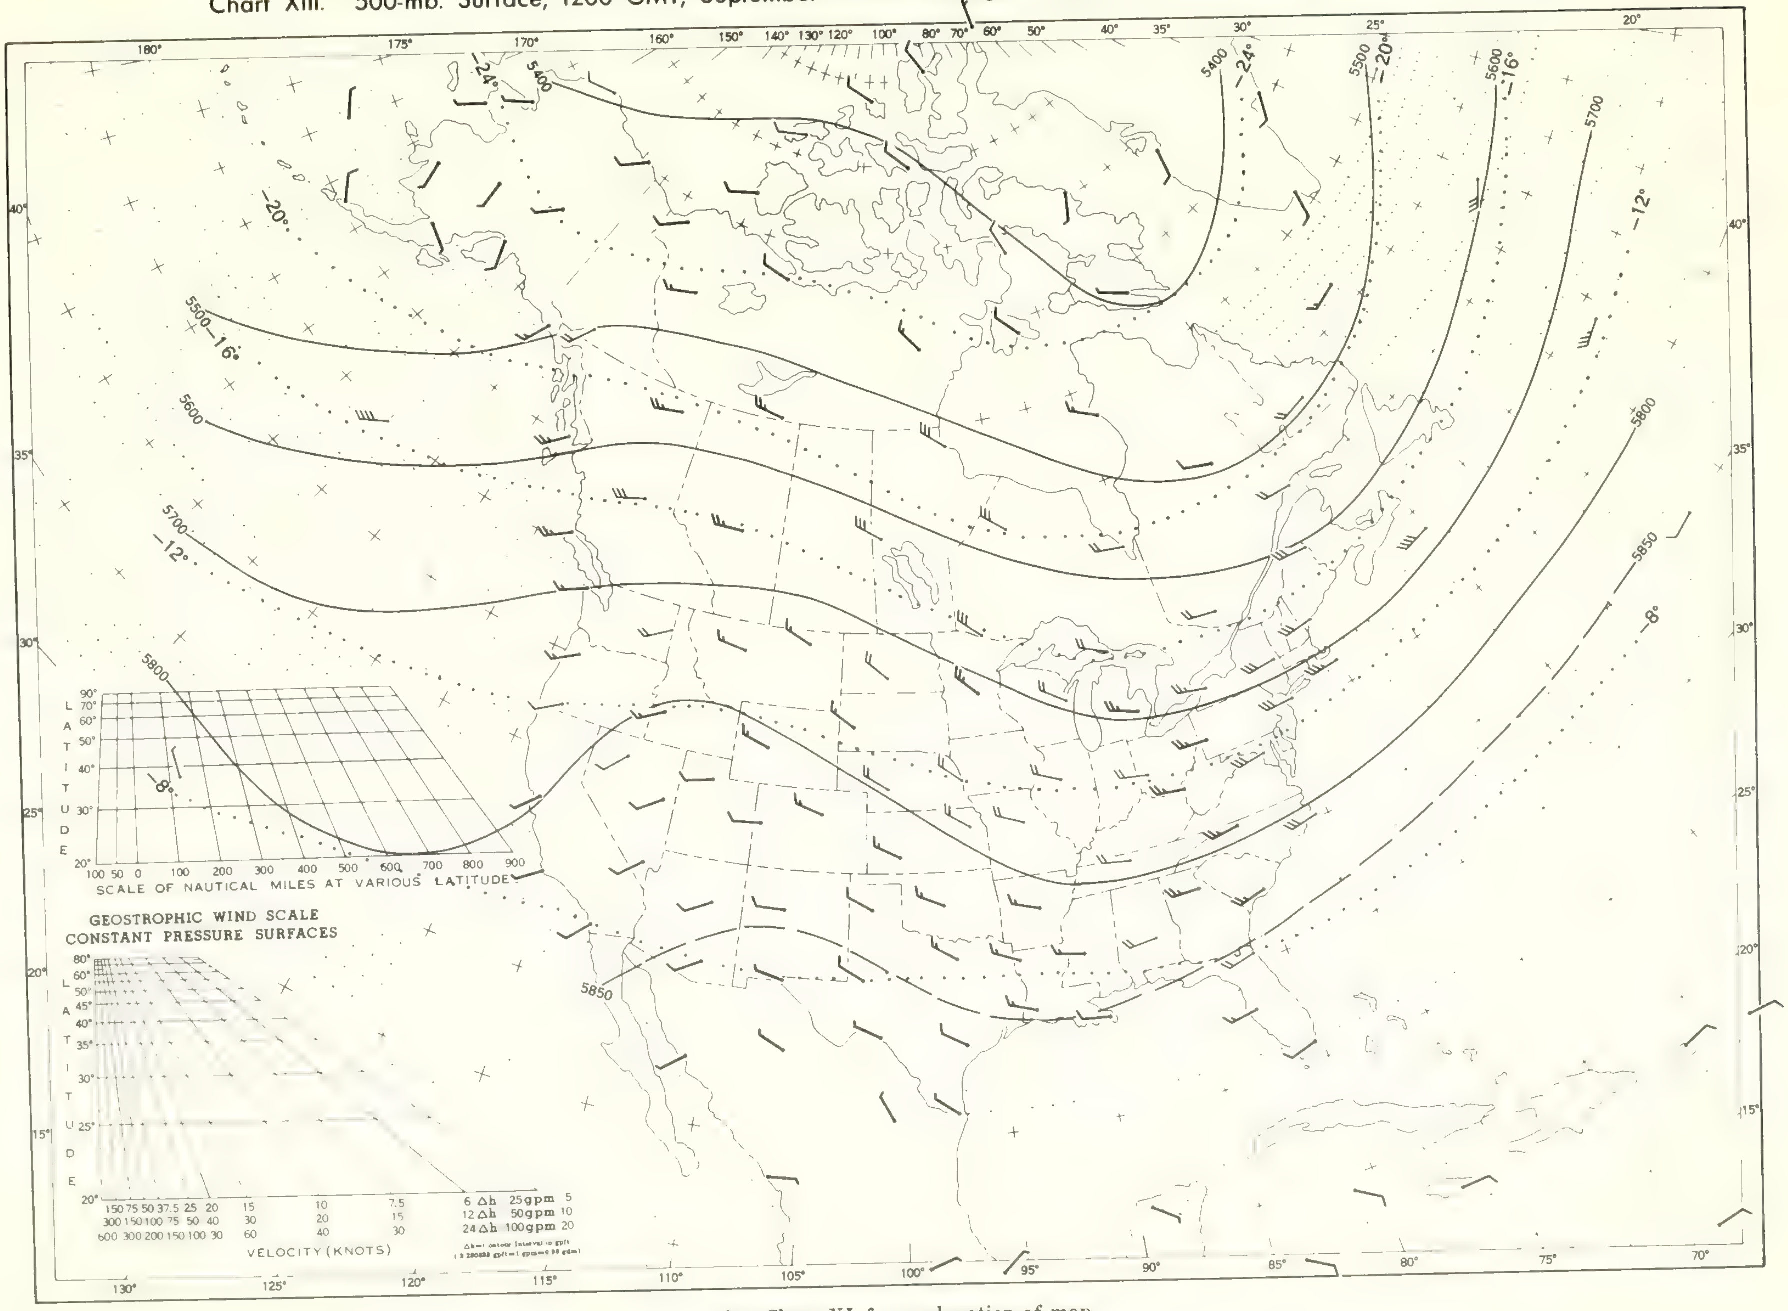
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, September 1966. Average Height and Temperature, and Resultant Winds.



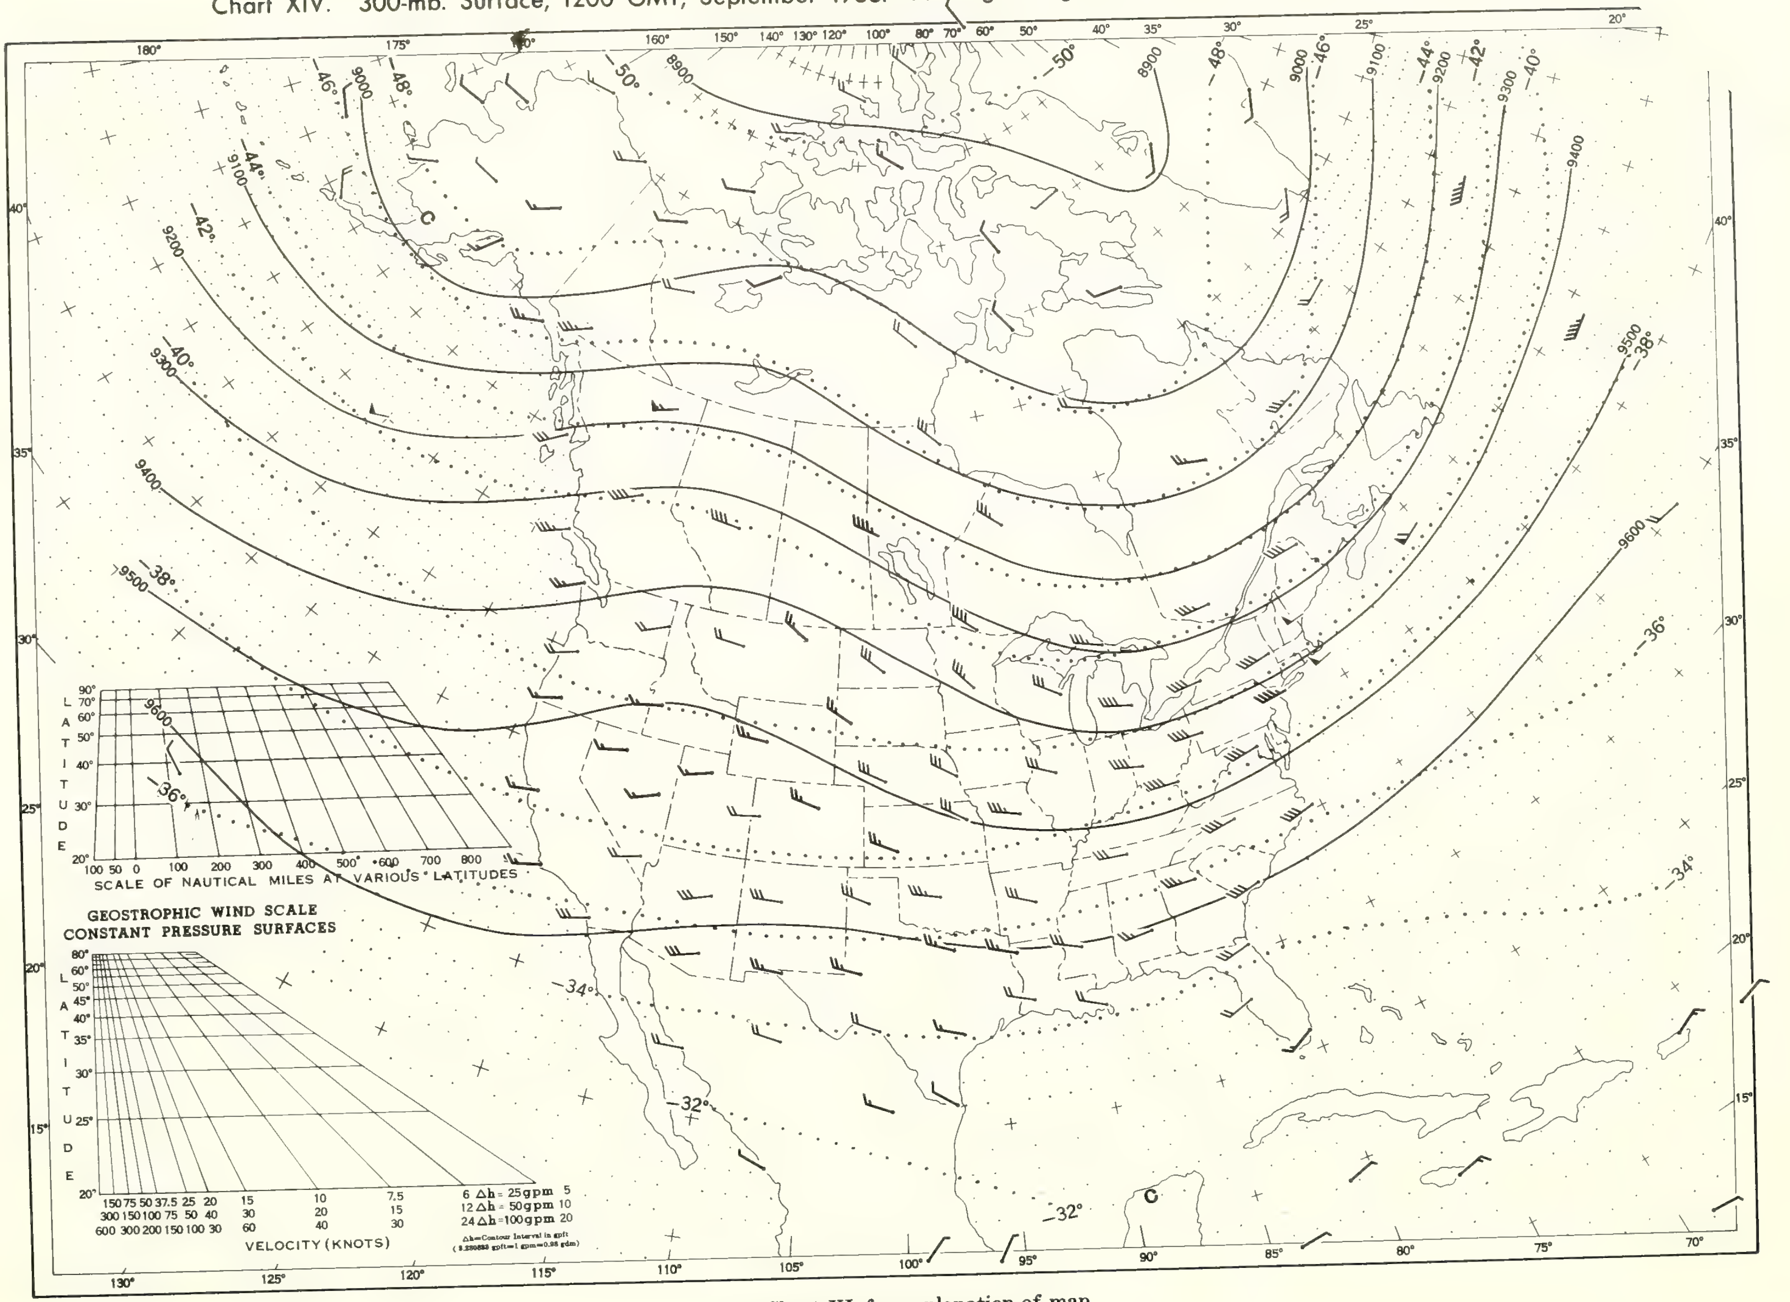
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, September 1966. Average Height and Temperature, and Resultant Winds.



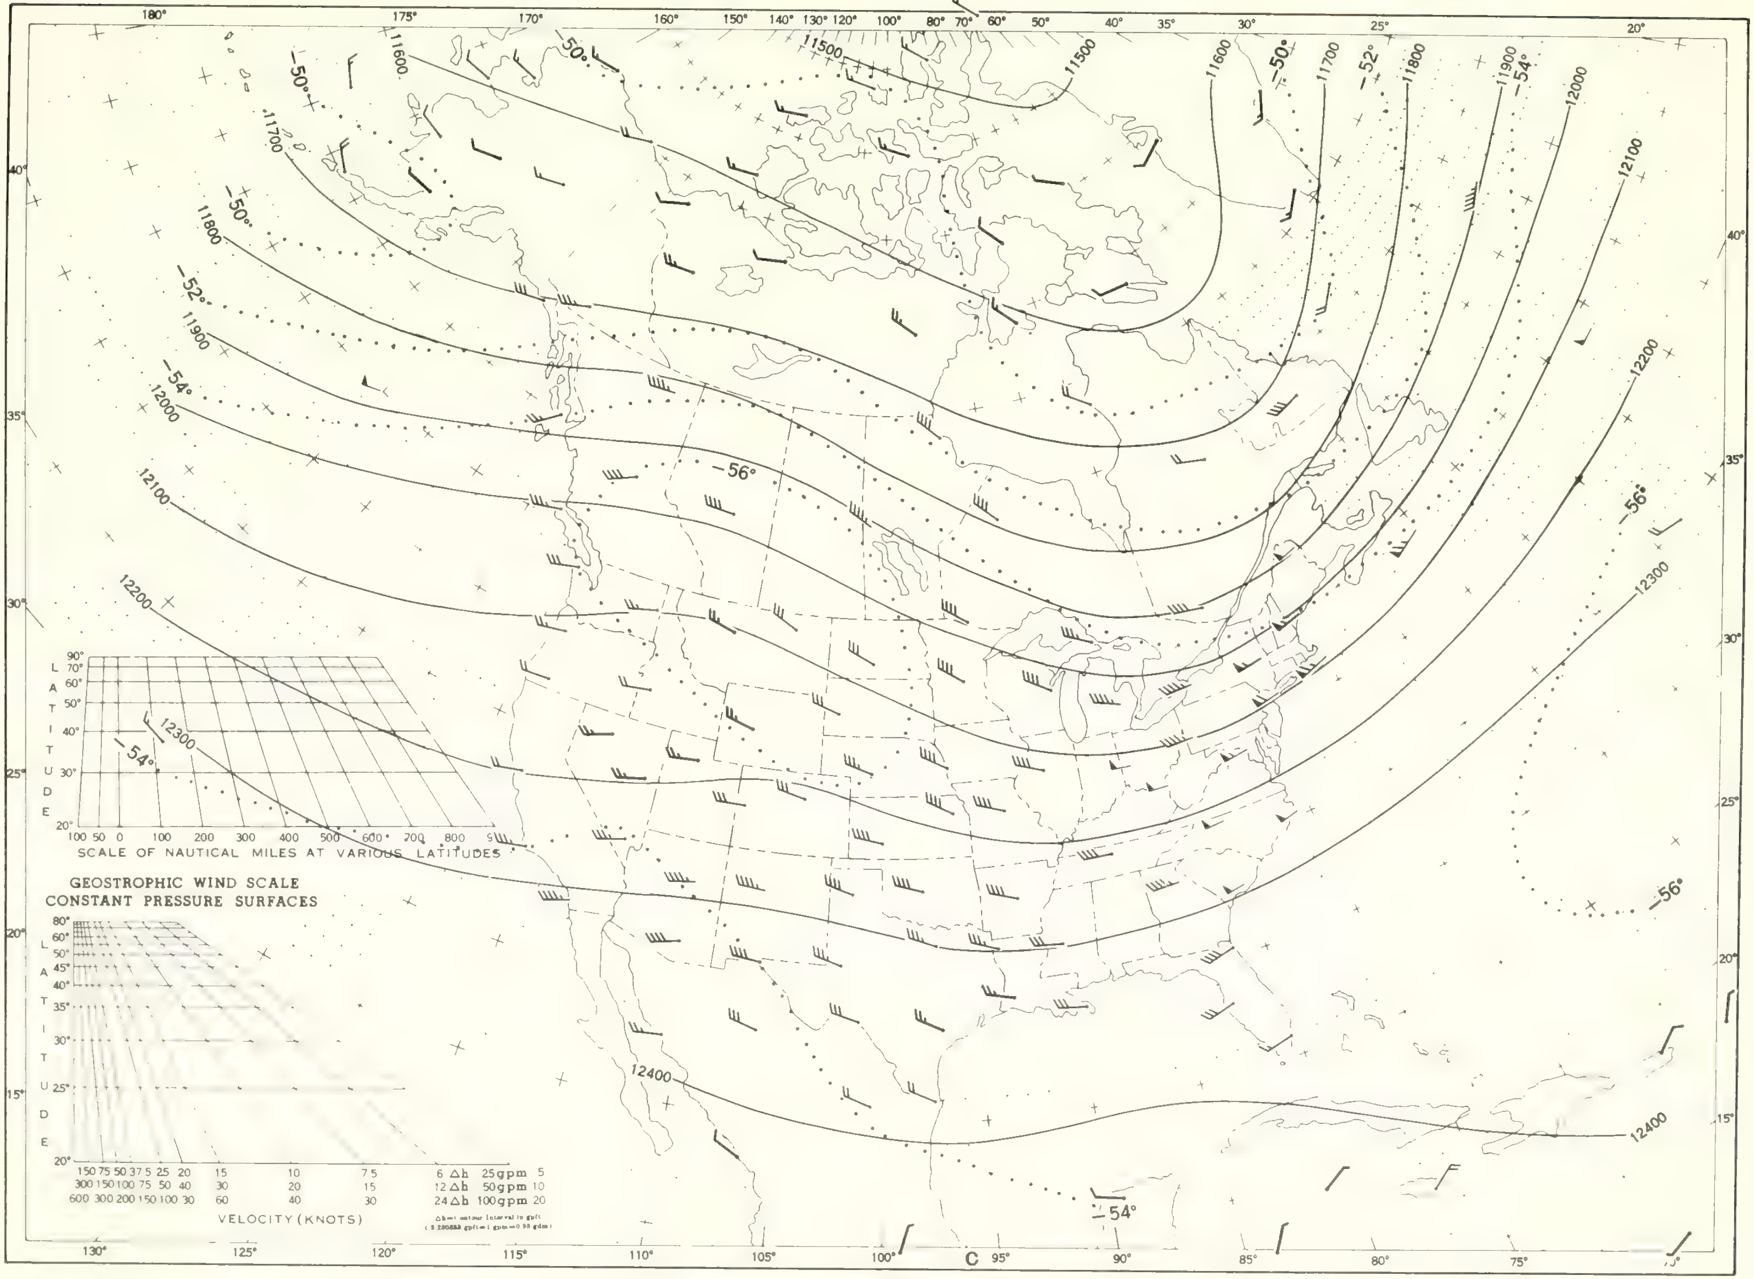
See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, September 1966. Average Height and Temperature, and Resultant Winds.



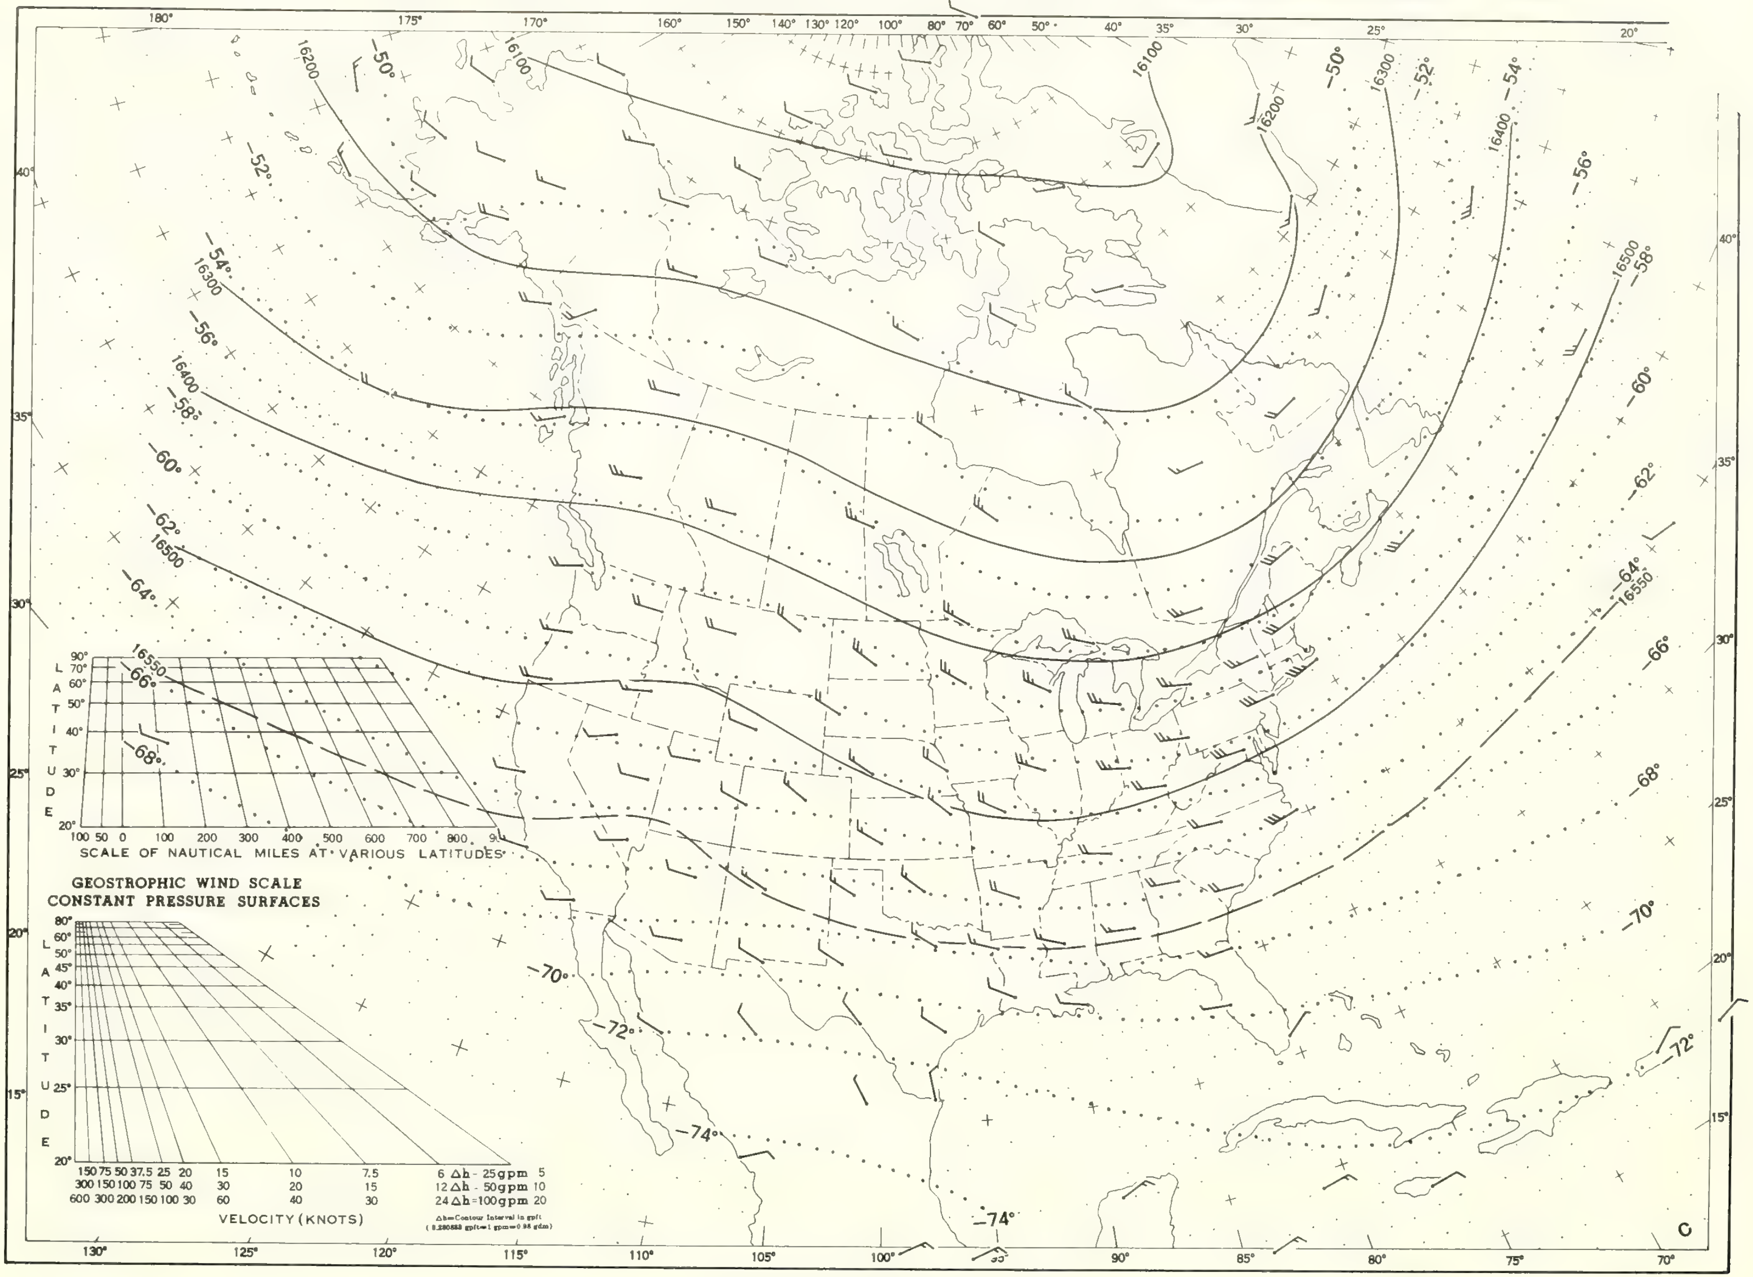
See Chart XI for explanation of map.

Chart XV. 200-mb. Surface, 1200 GMT, September 1966. Average Height and Temperature, and Resultant Winds.



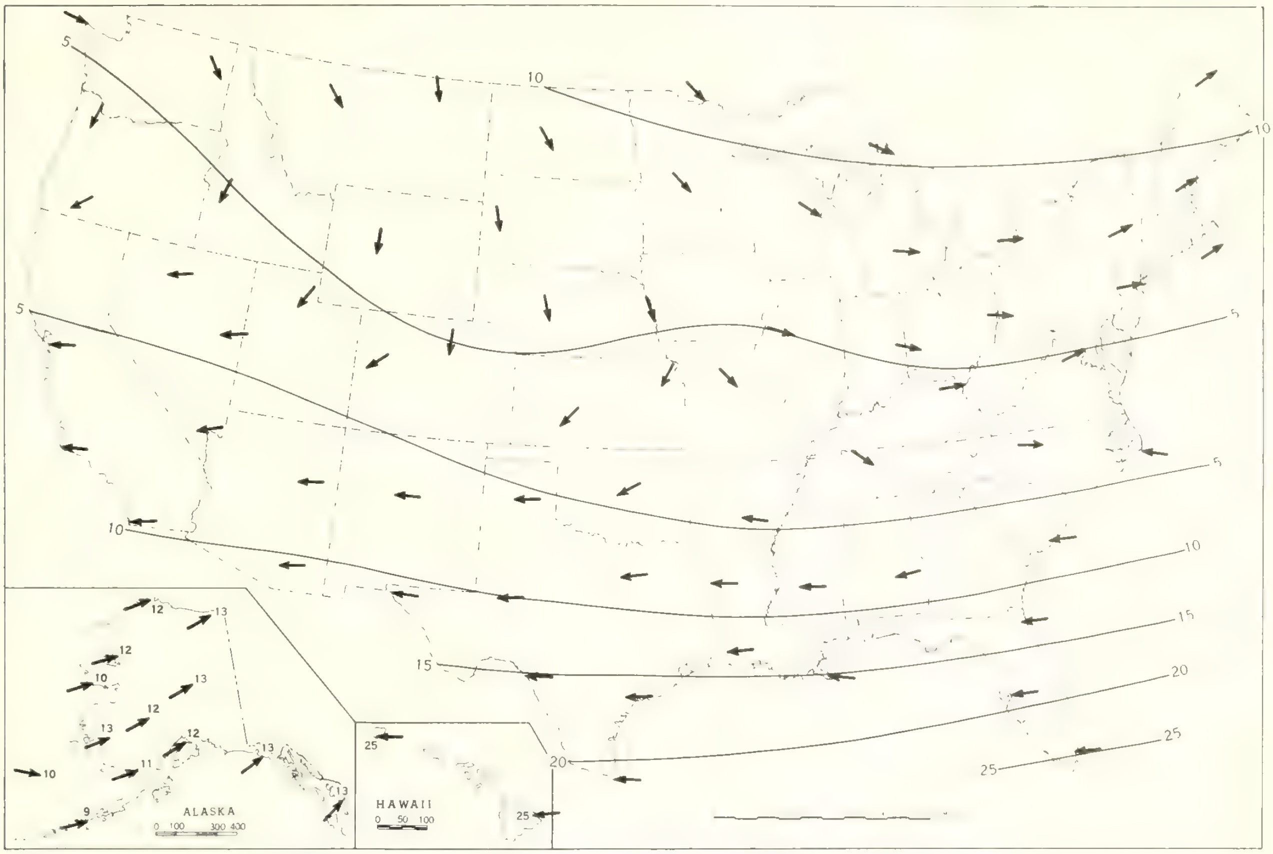
See Chart XI for explanation of map.

Chart XVI. 100-mb. Surface, 1200 GMT, September 1966. Average Height and Temperature, and Resultant Winds.

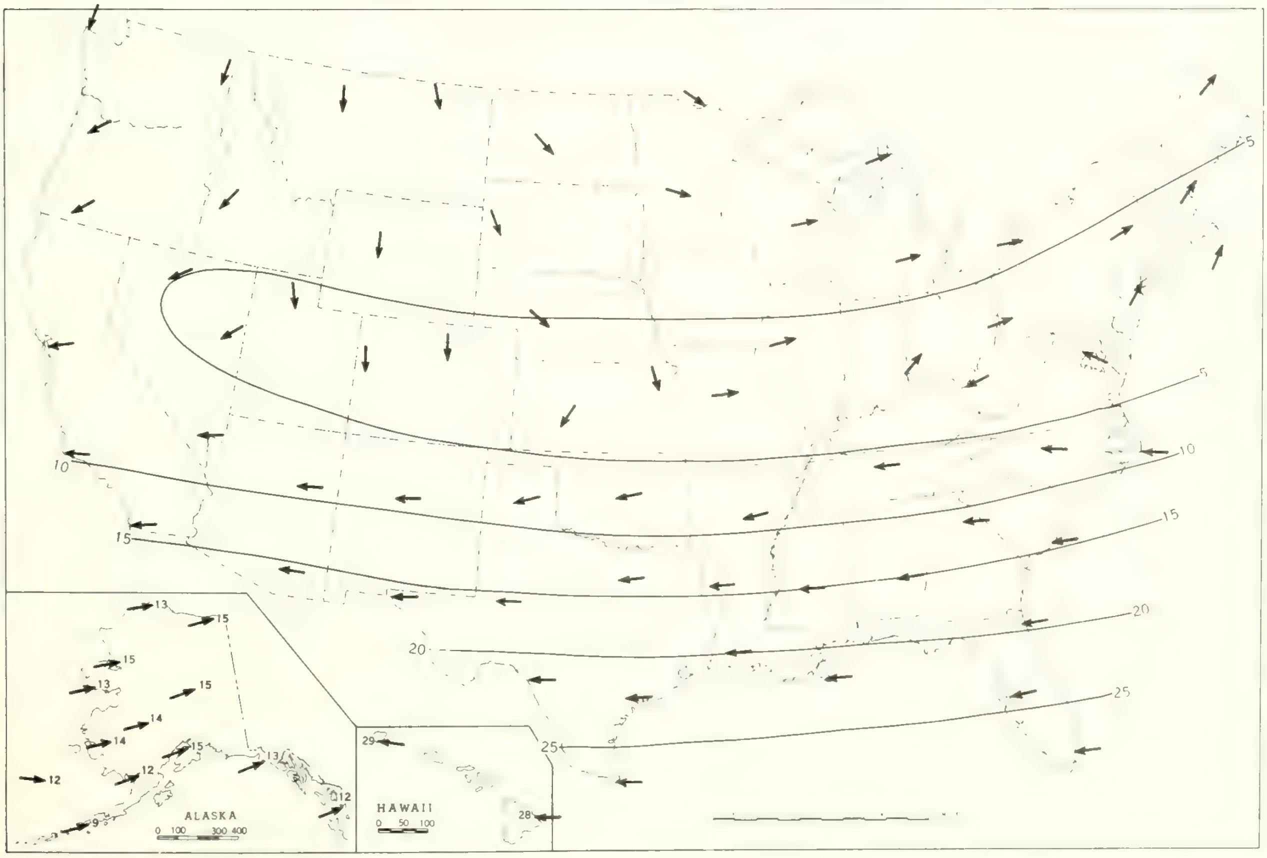


See Chart XI for explanation of map.

Chart XVII. A. 50-mb. Surface, 1200 GMT, September 1966. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, September 1966. Resultant Winds.



Wind speed (isotachs) in knots. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 10 OCTOBER 1966

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Weather generally cool and dry.
2. Heavy precipitation eastern Alabama to Connecticut.
3. Stormy north-central areas 12-16th.
4. Heavy snowstorm upper Rockies.
5. Tornado disaster at Belmond, Iowa, 14th.
6. Hurricane Inez crossed Florida Keys on 4th.
7. Early freezes in much of South.

TEMPERATURE.--Frequent cold air intrusions produced a rather cold and stormy October in 1966. Numerous stations across the Nation reported the coldest October in several years. Roswell, N. Mex., had its coldest October since 1932; Providence R. I., since 1940; Pocatello, Idaho, since 1949; Memphis, Tenn., and Jackson, Miss., 1952; and Amarillo, Tex., and several stations in South Dakota since 1959. Many stations also reported their record lowest temperatures for so early in the season. Among these were Medford, Oreg., and Boise, Idaho, with 26° and 21°, respectively, on the 14th; Concordia, Kans., 24° on the 16th; San Antonio, Tex., 34° on the 20th; and Providence, R. I., 24° and Concord, N. H., 14° on the 31st. The 14° at Concord was also the lowest ever recorded there in October during a 95-year record.

Frosts and freezes were unusually early although no extensive damage was reported. Freezing in the vicinity of Pocatello, Idaho, during the period 13-16th caused considerable damage to unharvested potatoes, while a freeze in western Colorado on the 15th killed garden crops and unharvested commercial tomatoes in the Colorado River Valley. At Topeka, Kans., the first freeze on the 10th was 13 days earlier than usual and the first hard freeze (24° or below) on the 16th was 13 weeks ahead of the average date.

Even though the month was generally cold, there were a few scattered areas where temperatures averaged above normal. The two main areas included most of California, the south Atlantic coast, and the Florida Peninsula. The highest average departure from normal was 2° in southern California. Warm weather in northwest California maintained a high fire hazard, although no serious fires were reported. At Fresno, Calif., 91° was a record high for October 25, and at Red Bluff, Calif., 92° was a high for the 31st. Denver, Colo., recorded 25° and 22° for the 14th and 15th, respectively, records for both dates back to 1871. In the Southeast, Wilmington, N. C., recorded a late season high of 90° on the 17th for a 96-year record. At Milwaukee, Wis., after a reading of 31° on the 2d - the lowest for the date since 1886 - temperatures rose to 82° on the 8th, equaling the record for the date set in 1905.

The first week was mild along the Canadian border and in Florida. The second week was cold nearly everywhere, with temperatures averaging above normal only along the Gulf, in the Ohio Valley, and in the Atlantic Coastal States except Delaware, New Jersey, and New England. The next week was the coldest period of the month, with temperatures averaging slightly above normal only along the south Atlantic and central and southern California coasts. Temperatures dropped below freezing in nearly all interior areas. This was the second consecutive cold week in the western half of the 48 States. The last week was much warmer than normal in most areas west of the Mississippi but abnormally cold weather persisted in most of the East.

Temperatures in the 48 states ranged from 104° at Centerville, Calif., and Rio Grande City, Tex., on the 1st, to -6° at Farson, Wyo., on the 14th. Subzero minima also were recorded in California, Colorado, Nevada, and New Hampshire, and freezing or below in all the 48 States, except Florida.

PRECIPITATION.--The precipitation pattern was spotty, with heavy monthly totals between the Great Lakes and northern Rockies, and in another area extending from the central Gulf coast northeastward to Connecticut. In both areas monthly amounts ranged up to more than twice the normal. Precipitation was less than half the normal in parts of the Florida Peninsula, in much of a large area extending from Ohio southwestward to New Mexico and northwest Texas, and in the Great Basin and Pacific States.

During the first week moderate to heavy rains fell in the lower Rockies, Texas, the extreme upper Mississippi Valley, in much of an area extending from Michigan to Alabama and Georgia, and in southern Florida. The rains in the latter area were associated with hurricane Inez, and those elsewhere with frontal activity.

Precipitation the second week was moderate to heavy in the northern Rockies, portions of the upper Great Plains, from the Mississippi eastward to the Appalachians, and in the New York-New England area. Weekly totals of 2 to 4 inches or more were common in the upper Mississippi Valley and along the Louisiana-Texas coast. Most of this precipitation was associated with a major storm that moved across the upper Great Plains and the Great Lakes on the 14th and 15th.

During the third week moderate to heavy precipitation fell along the north Pacific coast, in North Dakota, the lower Mississippi Valley, the South, the Appalachian region, and the Atlantic Coastal States. Over 2 inches fell in a belt extending from the southern Appalachians northeastward to the Atlantic coast from Virginia to Connecticut. The rains in the East were associated with a frontal system that moved across the area early in the week.

The last week passed without precipitation in most areas. Moderate to heavy showers were limited mostly to the lower Appalachian region early in the week.

The heavy rains in the East were of great benefit in the Northeast Drought area. At the end of the month extreme drought was limited to sections in eastern Pennsylvania. Dry weather in the southwestern Great Plains limited growth of small grains in some sections.

SNOWFALL.--Snowfall was unusually heavy for October in the Northwest. Nearly a foot accumulated in the higher mountains of Wyoming during the first few days of the month. Unusually heavy snow fell over the central Rockies and adjacent Great Plains areas and upper Great Lakes about midmonth. During this storm accumulations up to 18 inches were reported in the central Rockies. On the 13th Lander, Wyo., measured 19.4 inches, a record 24-hour amount there for October. An inch fell at Rapid City, S. Dak., and up to a foot in the nearby Black Hills. Duluth, Minn., measured 7.9 inches during this storm, the heaviest snowfall on record there for so early in the season. Another storm in the Pacific Northwest during the third week produced up to 30 inches of new snow in the Cascade Mountains.

DESTRUCTIVE STORMS.--During the passage of a vigorous low pressure system across the upper Mid-continent region during midmonth, numerous severe local storms, including a few tornadoes, were reported. On the 14th Iowa's worst late-season tornado virtually destroyed Belmond, with a loss of 6 lives and with 172 injuries reported. The midmonth snowstorm caused considerable damage to trees and shrubbery in the vicinity of Denver, Colo., and to utility lines in a 5-county area in the northwest corner of Kansas. Damage in eastern Nebraska during this same storm was associated with winds up to 73 m.p.h.

Hurricane Inez crossed the Florida Keys on October 4 with measured wind speeds up to 130 m.p.h. In southern Florida 3 persons lost their lives and 11 were injured. Damage was estimated at about $5 million.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.
A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

HURRICANE INEZ, SEPTEMBER 21 - OCTOBER 11

Richard M. De Angelis
Marine Branch, Evironmental Data Service

Hurricane Inez, winding its way through the northern Caribbean Sea, the Straits of Florida and the Gulf of Mexico, paid unwelcome visits to Guadeloupe, Hispaniola, Cuba, the Florida Keys and the Yucatan Peninsula before finally exhausting itself over the mountains of central Mexico. This great hurricane, with maximum winds exceeding 140 kt. and minimum pressure dropping to 927 mb. left a path of devastation, devastation which may total more than 1,000 dead and $200 million in damage when a final evaluation is made.

Inez, organizing some 1,400 mi. east of the tropical island of Trinidad on September 21, spent the first 5 days of its 21-day existence in the development stage. Under the watchful eyes of reconnaissance aircraft the storm matured to hurricane strength, while maintaining a west-northwesterly track and a forward speed of about 10 kt. Inez reached hurricane intensity on the 26th but it was not until the following day that its effects were first felt on land.

Generating winds up to 105 kt., with a central pressure of 961 mb., hurricane Inez battered the Leeward Islands from Antigua to Dominica with hurricane force winds, as its center passed over Guadeloupe on the 27th. Strong winds, high tides and torrential rains in Guadeloupe destroyed thousands of homes as small villages were virtually swept away. Total damage has been estimated near $50 million with 27 people killed and about 600 injured.

Hurricane Inez, continuing to intensify, traversed the eastern waters of the Caribbean and by the 28th was buffeting the southern coast of Puerto Rico with gale force winds. Although the storm was generating maximum winds of 130-150 kt. near its center, with a minimum pressure of 932 mb. the island was spared most of its fury when the storm's center passed about 75 mi. to the south. Maximum winds reached 26 kt. with gusts to 45 kt. along the southern coast. Mona Island, a short distance west of Puerto Rico, estimated winds near 60-70 kt. on the evening of the 28th.

Early on the 29th Inez reached its peak intensity when the central pressure dropped to 927 mb. generating maximum winds of 140 kt., and hurricane force winds outward 70 mi. from the center. Lashing the southern coast of the Dominican Republic, the severe hurricane made its way to the Barahona Peninsula where winds of 100 kt. or more raked the entire peninsula and tides 10-15 ft. above normal inundated the entire southern coast of the Dominican Republic. After ravaging the Barahona Peninsula, Inez turned its full fury on Haiti. Moving through the "Valley of Death," a deep trough between two mountain ranges on the Tiburon Peninsula of Haiti, the storm touched off torrential rains and local winds may well have exceeded 140 kt. Accelerating northwestward Inez passed over the island of Gonave late on the 29th pounding western Haiti with hurricane force winds, torrential rains and 10- to 15-ft. tides which flooded the northern shores of the Tiburon Peninsula.

Total damage in Hispaniola was estimated near $32 million -- $12 million in the Dominican Republic and $20 million in Haiti. Between 74 and 100 people lost their lives in the Dominican Republic while a rough estimate in Haiti puts the figure at 750. (In 1963 hurricane Flora moved through the same area in Haiti killing some 5,000 people and causing $125 million worth of damage.) Estimates of 1,000 people injured in Haiti and 450 seriously injured in the Dominican Republic have been reported.

After battering Hispaniola for more than 24 hr., Inez moved into the Caribbean again and reorganized for its invasion of Cuba. On the 30th of September the hurricane pushed into southeastern Cuba between Guantanamo City and Santiago. Minimum pressure at this time was near 985 mb. and Guantanamo City reported a sustained wind of 120 kt. The U. S. Naval Base at Guantanamo Bay was hammered as the storm crossed Oriente Province; none of the base personnel were seriously injured. More than 125,000 people were evacuated from low-lying coastal areas and only one death was reported as 6- to 10 ft. tides swept the southeastern coast. Cuba's Sierra Maestra Mountains left Inez weak and disorganized. Drifting northwestward, the storm spread heavy rains and strong winds over most areas in Oriente Province. Early on the 1st of October Inez turned westward and moved into the Gulf of Guacanaybo. Remaining over water only briefly, the weak storm turned northward and moved inland again near Trinidad, Cuba. Poorly organized and generating below hurricane force winds, Inez drifted northward and moved off the coast north of Santa Clara early on the 2d. Maximum winds at this time were 45 kt. and central pressure had risen to 994 mb.

Inez, moving into the Florida Straits, regenerated to hurricane strength late on the 2d some 95 mi. south-southeast of Miami. About this time the revitalized hurricane spawned a tornado in Nassau which killed one person and injured three others as it ripped across New Providence Island. Following a north-northeast course Inez continued to intensify; its renewed violence was felt on the 3d when a 23-ft. boat with 46 Cuban refugees aboard, sank in high seas about 35 mi. south of Miami with only one survivor. Maximum winds increased to 75 kt. and pressure dipped to 985 mb. as storm-generated gales battered the southeast Florida coast and the northern Bahama Islands. Inez moved just east of the Bimini Islands (100 mi. east of Miami) where it stalled for about 8 hr. and then unexpectedly turned west-southwestward toward the Florida Keys. Maximum winds were observed at Bimini -- 70 kt. -- and minor flooding occurred in the Bahamas as 1 ft. of water poured into Nassau's main street. Three people were killed, bringing the total in the Bahamas to five. Communication facilities were disrupted and total damage was estimated at $15.5 million.

About 60 mi. north of Nassau the 17,243-ton Liberian freighter, VERONA, was disabled in high seas and 65-kt. winds, but managed to ride out the storm when Coast Guard cutters were unable to reach her. As Inez moved toward the Keys a 353-ft. Panamanian vessel, the FREIGHT TRANSPORTER was disabled 10 mi. off the mainland near Miami while an 82-ft. Coast Guard Cutter, POINT THATCHER, was beached by gales and heavy surf just off Miami Beach.

The Miami area felt the brunt of the storm early on the 4th as the center passed 45 mi. southeast of the city. Maximum winds at the National Hurricane Center in Coral Gables reached 40 kt. with gusts to 52 kt. at 0935 EST, and the lowest pressure recorded was 995 mb. at 0713 EST. Gales in the area occurred intermittently up to 35 hr., ending late on the 4th. Except for a momentary gust of 80 kt. at Flamingo and 65 kt. at Homestead Air Force Base, no winds of hurricane force were recorded on the mainland.

The Florida Keys, battered by gales early on the 4th, began to feel the full force of the storm on the afternoon of the 4th. Part of the eye passed directly over the Keys on its west-southwesterly journey. Slowly intensifying as it moved through the Keys, the storm dealt its strongest winds after the passage of the eye. Lowest recorded pressure in the Keys was 983 mb. at Islamorada. Higest reported winds were 85 kt. at Plantation Key.

Tides along the southeast coast of Florida and in the Keys were about 2-4 ft. above normal. Hurricane force winds in the Keys generally lasted about 4 hr. Damage in Florida -- including the Keys -- was restricted to Dade, Broward, and Monroe Counties and totaled about $5 million. Forty-eight people lost their lives; 45 were Cuban refugees in a small boat.

Located just south of Dry Tortugas early on the 5th Inez, packing winds up to 90 kt. and with a central pressure of 985 mb., headed away from the Keys on a west-southwesterly track. Once again Cuba -- this time the northwestern section -- felt the fury of hurricane Inez as the storm's center passed 60 mi. northwest of Pinar Del Rio Province early on the 6th. Havana reported 12 in. of rain in 30 hr. as coastal sections west of the capital were battered by strong winds, torrential rains and high tides. In the low-lying coastal areas of Havana Province 21,000 people were evacuated because of the flooding and 4 people lost their lives, bringing Cuba's total to 5. Thirty people were injured in Cuba and total damage was estimated at $20 million. After lashing Cuba, Inez turned toward the Yucatan Peninsula.

While Inez moved through the Bahamas to the Yucatan Peninsula many ship reports confirmed the intensity of the storm. On the 3d the TEXACO NORTH DAKOTA, about 25 mi. southeast of Miami, reported a north wind of 50 kt. while the following day the P. W. THIRTLE, in the same area, reported an 85-kt. easterly wind, accompanied by a pressure of 994.9 mb. Late on the 4th the ESSO LIMA passed near the eye of the hurricane and recorded a 90-kt. wind with a pressure of 990.9 mb. The FLYING "A" DELAWARE within 80 mi. of the storm's center, on the 6th reported a 50-kt. wind. Late on the 6th and into the 7th the INGER was battered continuously by winds of 50-kt. or more for about 6 hr. as she sailed northward in the wake of the storm.

Intensifying slowly, the hurricane moved southwestward to within 50 mi. of the extreme northeastern tip of the Yucatan Peninsula by late on the 6th. At this time central pressure was 961 mb. and maximum winds reached 95 kt. Inez, changing to a west-southwesterly course, paralleled the Yucatan coast lashing the sparsely-populated coastal sections with hurricane force winds, high tides and torrential rains before departing late on the 7th. Evacuation of some 15,000 people from Progreso, in anticipation of the storm, held loss of life to a minimum. Thirteen fishermen were feared drowned in the backlash of the hurricane as it moved into the open waters of the southwestern Gulf of Mexico.

By the 8th Inez was well out to sea (330 mi. southeast of Brownsville, Texas). Energized by the warm waters of the Gulf of Mexico, the storm intensified with maximum winds reaching 115 kt. and pressure falling to 948 mb. The storm, continuing its erratic movement turned to a northwesterly track that threatened Texas. Preparations were made along the Texas-Louisiana coasts to remove offshore oil drillers. A helicopter, assisting in the evacuation, crashed off the Louisiana coast, killing all 11 people aboard.

For the next 24 hr. the hurricane drifted northwestward, weakening slightly, and by late on the 9th the center was located about 200 mi. southeast of Brownsville. The central pressure was 960 mb. and maximum winds were 115 kt. Inez then turned toward the Mexican coast. On the 10th the hurricane moved inland about 40 mi. north of Tampico -- which was reporting 85-kt. winds with gusts to 95 kt. Tides 10-12 ft. above normal pummelled the coast just north of the eye, while torrential rains touched off extensive flash flooding in the southern half of the State of Tamaulipas. Soto la Marina, midway between Tampico and Brownsville, reported 10.12 in. of rain in 24 hr. Inez, moving inland over mountainous terrain, began to dissipate and, early on the 11th, about 70 mi. west of Tampico, finally exhausted itself. Mexico, hit extremely hard, reported 65 people killed with 250 injured and damage totaling an estimated $100 million.

C Crop damage
R Rain

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
∅ For breakdown of "All Others", and for detailed listing of other storms, see the U. S. Weather Bureau monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5,000,000
7	$5,000,000 to $50,000,000
8	$50,000,000 to $500,000,000
9	$500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

OCTOBER 1966

Elmer R. Nelson, Office of Hydrology

There was no significant flooding reported in the Country during October.

ATLANTIC SLOPE DRAINAGE

Heavy rains on the 19th caused light flooding on the Millstone River at Blackwells Mills, N. J., and on Assunpink Creek at Trenton, N. J., on the 19th and 20th. Rancoas Creek at Pemberton, N. J., reached, but did not exceed flood stage on the 20th. New 24-hour rainfall record amounts occurred through the central and northeastern portions of New Jersey. No flooding of importance occurred on larger streams but some flash flooding was reported on small streams. Flood damage occurred for the second consecutive month at Elizabeth, N. J.

Two to three occurrences of substantial rain during October brought the total rainfall for the month to above normal for southern and central New England and Maine. A flash flood bulletin for minor overflow of small streams and brooks in the southern two-thirds of Maine was issued by the Weather Bureau on the 20th.

In the Susquehanna Basin in Pennsylvania, precipitation during the month averaged 56 percent of normal. The average monthly flow of the Susquehanna River at Harrisburg, Pa., was 33 percent of the normal average monthly flow for October. Only minor rises occurred during the month.

In the Potomac Basin in Virginia and Maryland, precipitation (2.68 inches) during October averaged near normal. There was some minor flooding of small streams in central and northern Virginia, but no damage was reported.

Precipitation during the month ranged from 1 inch above normal over the Dan and upper Roanoke Basins in Virginia to more than 2 inches below normal at numerous locations along the lower reaches of the Cape Fear, Neuse, Roanoke, and Tar River Basins in eastern North Carolina. No flooding was reported during October. However, a sharp rise of 10 feet occurred along the middle reaches of the upper Roanoke from heavy precipitation (2.5 inches), on the 18th and 19th. Only minor rises of 2 to 4 feet were reported elsewhere in eastern North Carolina. The Tar River at Greenville, N. C., receded to a new low water record of 1.6 feet. The previous lowest stage of record at this point was 1.9 feet in 1925.

Total rainfall in South Carolina during the month ranged from about 1/4 inch along the coast to about 6 inches in the extreme upper Yadkin Basin near its source. Rainfall, in general, was below normal from the coast to the Fall line and above normal from the Fall line to the Blue Ridge Mountains. All streams remained well within their banks except for an 8- to 10-foot rise along the Yadkin beginning on the 19th following heavy rain. The upper Santee River at Rimini, S. C., approached within 4 feet of flood stage on the 25th.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Although heavy rains (3 to 6 inches) occurred over southeastern Minnesota and parts of central Wisconsin from the 13th through the 15th, runoff was very light and no flooding was reported. Mean streamflow along the upper Mississippi River averaged near the long-term mean except in the reach from Brainerd to Minneapolis, Minn., where it averaged about 1 foot below. Compared to October 1965, streamflow this October averaged 3 feet below that of 1 year ago.

Ohio Basin.--An earth and concrete dam failure at Lake Latonka, Mercer County, Pa., on the 20th caused $50,000 in damages. Thirty families were evacuated from the low-lying sections of Mercer along Neshannock Creek. A powerline was washed out and several head of cattle were drowned. Routes 62 and 58 were closed to traffic for a short time. River levels elsewhere in the Ohio Basin above McMechen, W. Va., remained near seasonal levels with no flood stages being reached on the main rivers or major tributaries.

Minor flooding occurred on the South Chicamauga Creek near Chicamauga, Tenn., from the 18th to the 20th. No damage was reported.

Missouri Basin.--There was very little runoff from the occasional heavy rains in the basin due to the dry soil conditions. The streams remained low throughout the month.

Snow accumulations of 4 to 8 inches occurred in extreme northwestern Kansas on the 14th. This was one of the most severe snowstorms of record for the fall season in that area.

Arkansas Basin.--The Cimarron River at Perkins, Okla., had a monthly average stage of 1.7 feet which is a record low October average stage. The previous record low average stage was 1.8 feet recorded in 1956 and 1964. The normal average stage for this point is 4.2 feet. The Arkansas River at Van Buren, Ark., showed an average monthly stage of 5.9 feet, or 1.3 feet below normal.

Lower Mississippi Basin.--The lower Mississippi River remained at a low level during October. At Memphis, Tenn., the stage ranged from a low of 1 foot below zero (-1 foot) to 2.5 feet above the zero of the gage.

WEST GULF OF MEXICO DRAINAGE

The total rainfall during the month averaged near normal. Most of the rain occurred during the period from the 13th to the 18th, but had little effect on the rivers as the stages were low and the ground was dry.

Colorado Basin.--Some flash flooding occurred in Yuma County, Ariz., on the 4th. Timely warnings were issued by the Weather Bureau.

Great Basin.--Drought conditions continued during October. At Reno, Nev., only 0.75 inch of precipitation had been reported during the first 10 months of the year. This is less than 14 percent of the normal 5.5 inches for this period.

PACIFIC SLOPE DRAINAGE

Columbia Basin.--The Willamette River at Portland, Oreg., had an average stage of 2.5 feet during October. This was 0.2 foot below the mean October stage.

During the period from June through October the average stage at Portland ranked as the 10th lowest of record and the lowest since 1944. The record low stage for this period occurred in 1889.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations Relative humidity averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i. e., elevation angles less than 6° above the horizon, or any obstruction above the horizon

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available

Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G. C. T.

R More than half of the observations are from statistical values. Equipped with lithium chloride hygristor.

‡ Upper Air program transferred to Yucca Flat, Nev., October 10, 1966.

SOLAR RADIATION DATA

Solar radiation intensities, tabulated in langleys per minute on a surface normal to the direction of the sun. OCTOBER 1966

GUAM, M. I.

Date	A. M.				*	P. M			
	78.7°	75.7°	70.7°	60.0°		60.0°	70.7°	75.7°	78.7°
Air mass	4.92	3.93	2.95	1.97	*	1.97	2.95	3.93	4.92

Instruments inoperable October 1-13
No observations October 14-31 due to cloudiness

S Slight haze - indeterminable
M Moderate haze - indeterminable
I Intense haze - indeterminable
* Values corresponding to true solar noon
HS Slight haze
HM Moderate hzae
( ) Clouds present
† Surface obstruction

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note. --Langley is the unit used to denote one gram calorie per square centimeter.
Values with an asterisk are interpolated.

U Indicates Urban sites.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

OCTOBER 1966

NET RADIATION

Net radiation in langleys per day (midnight to midnight) at Huntley, Mont.

OCTOBER 1966

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	†	115	90	90	61	83	22	89	---

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. **The value represents the total incoming minus the total outgoing radiation of all wave lengths.**

* Recorder inoperative October 1-24, 1966

† Incomplete

These data are of an experimental nature and are published as received from the Huntley, Exp. Station. **The instrument with which they were measured has not been checked by the Weather Bureau.**

TOTAL OZONE DATA

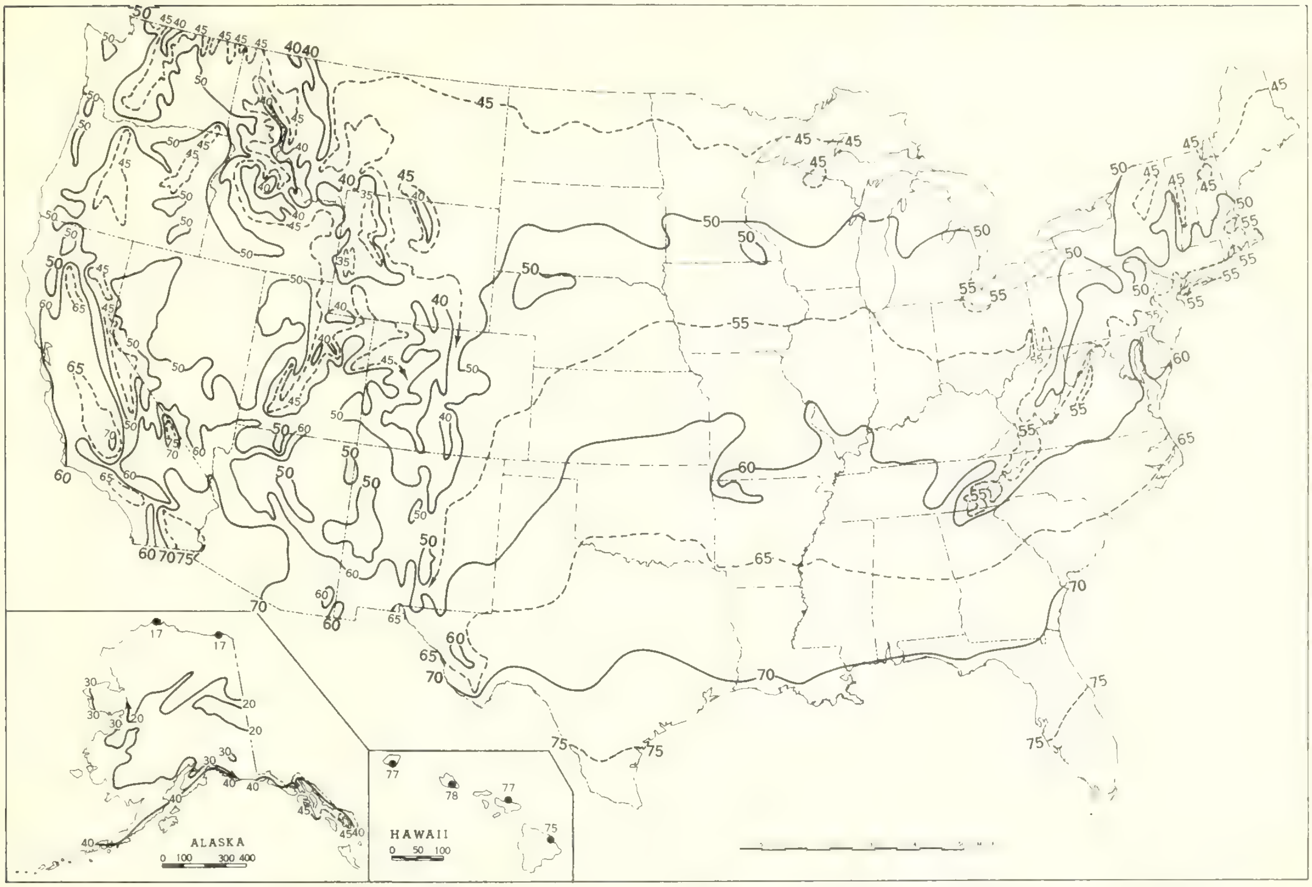
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

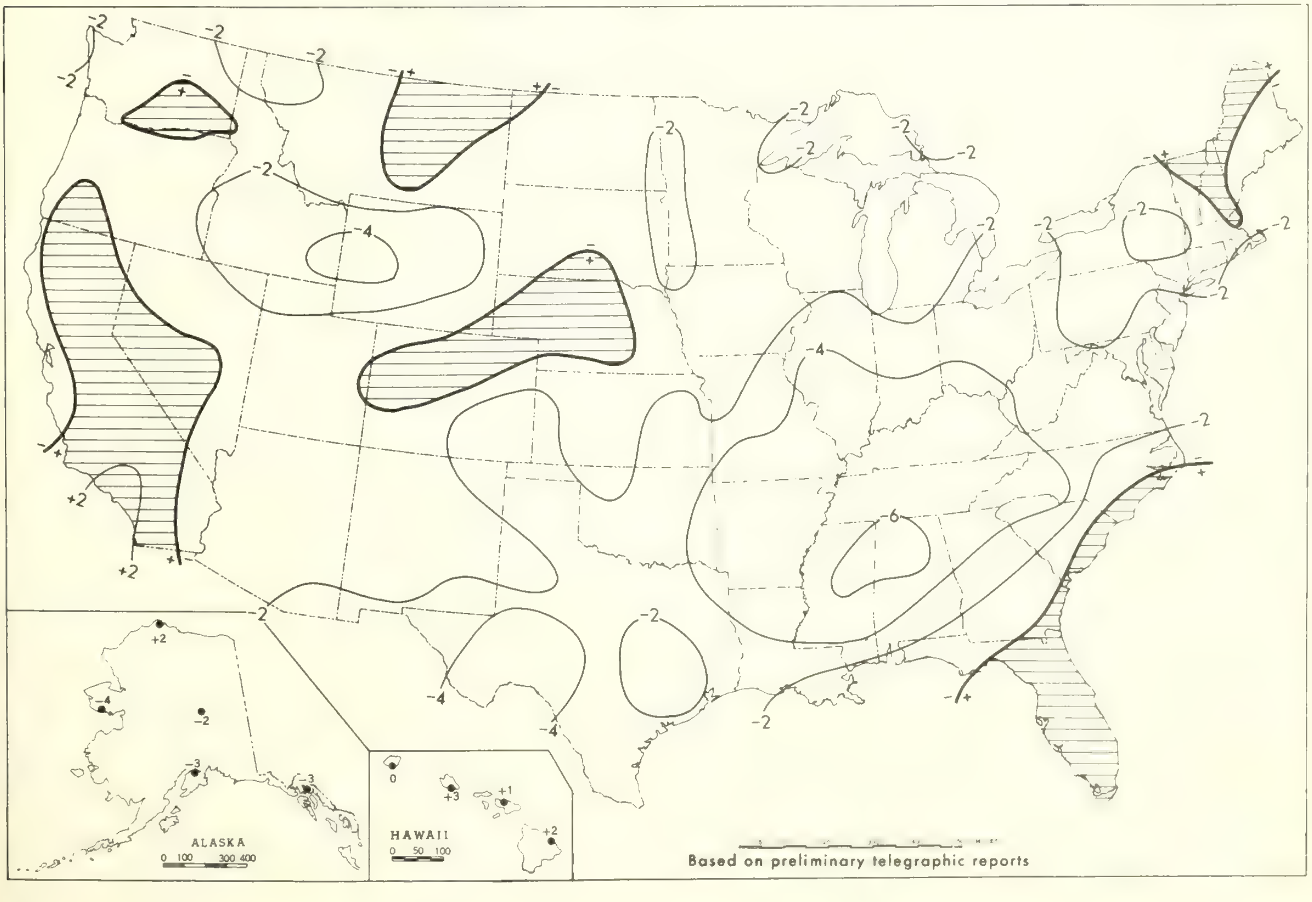
Station	Day of month																														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i. e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e. g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ s designates the type of measurement made.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), October

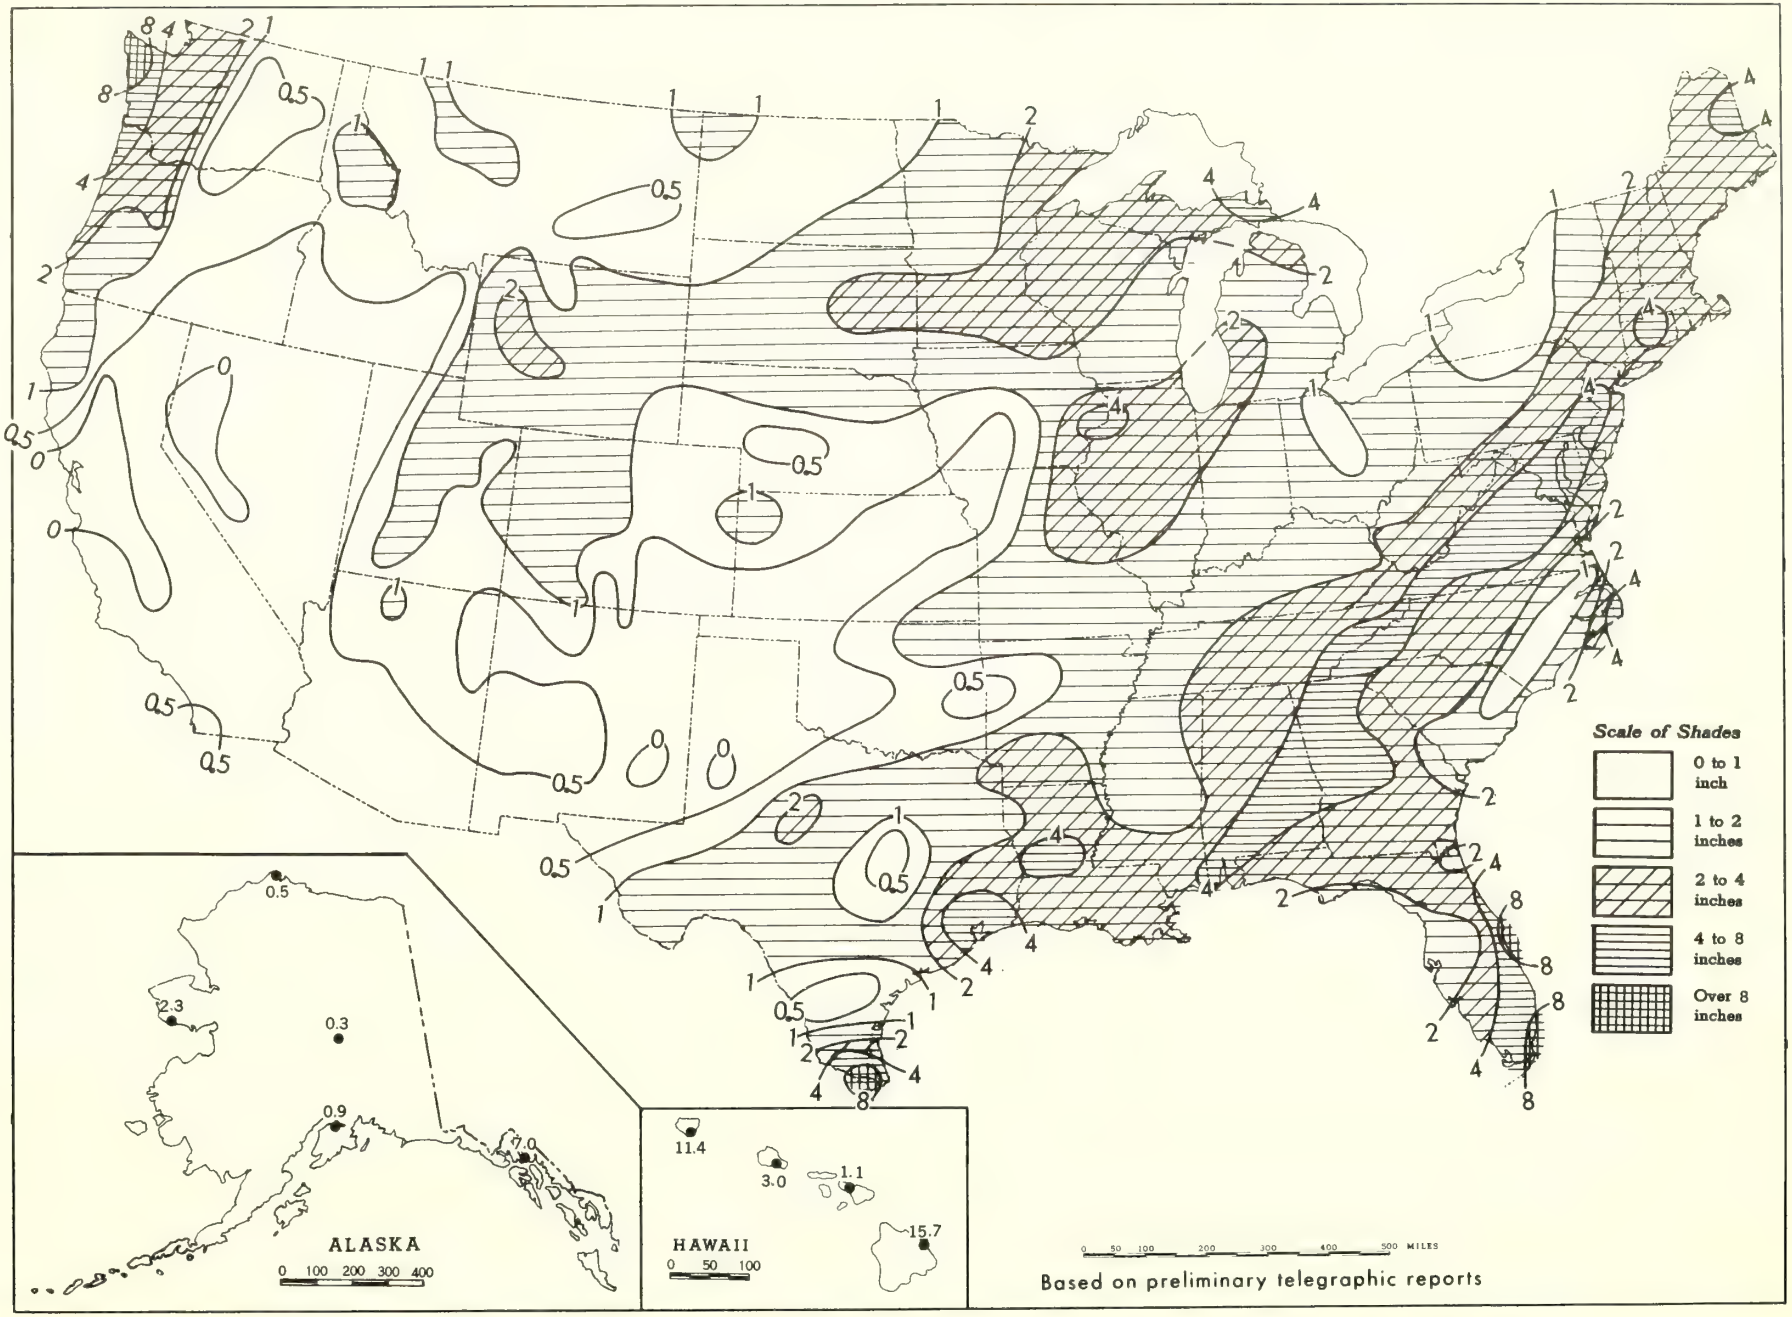


B. Temperature Departure from 30 - Year Mean (°F 1931-60), October 1966.



Based on preliminary telegraphic reports

Chart II. Total Precipitation (Inches), October 1966.



Based on preliminary telegraphic reports

Chart III. Percentage of Normal Precipitation, October 1966.

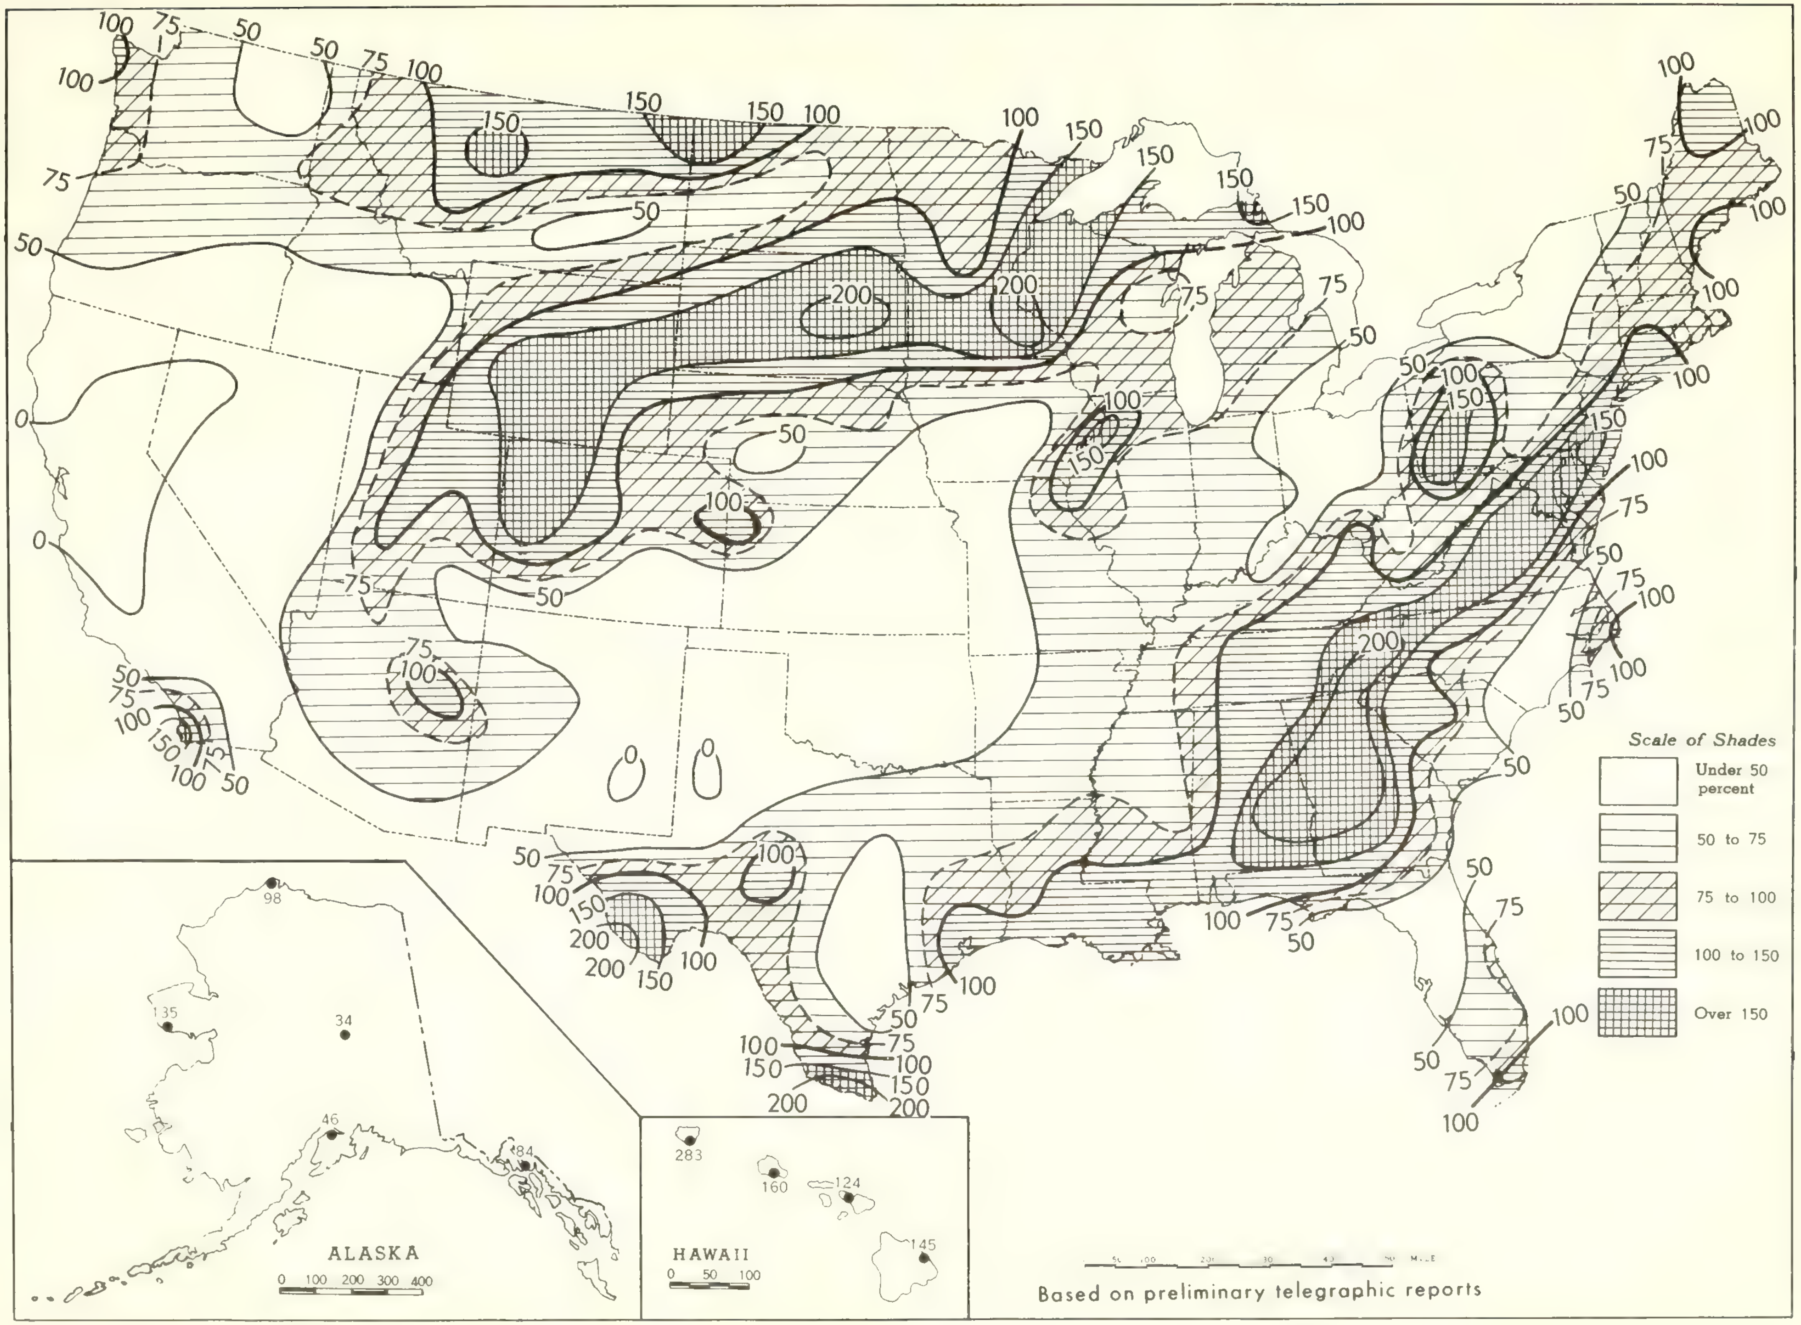


Chart VI. A. Percentage of Possible Sunshine, October 1966.

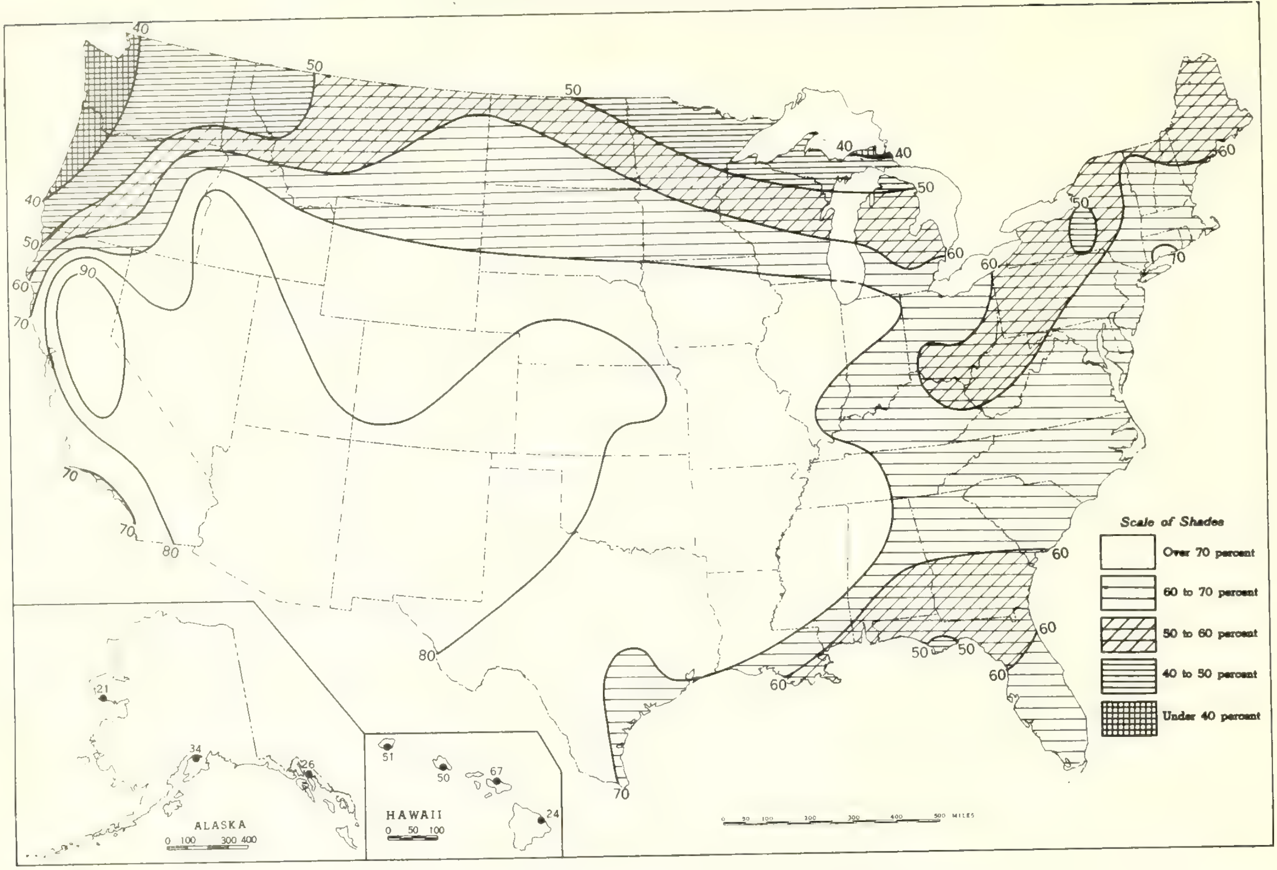
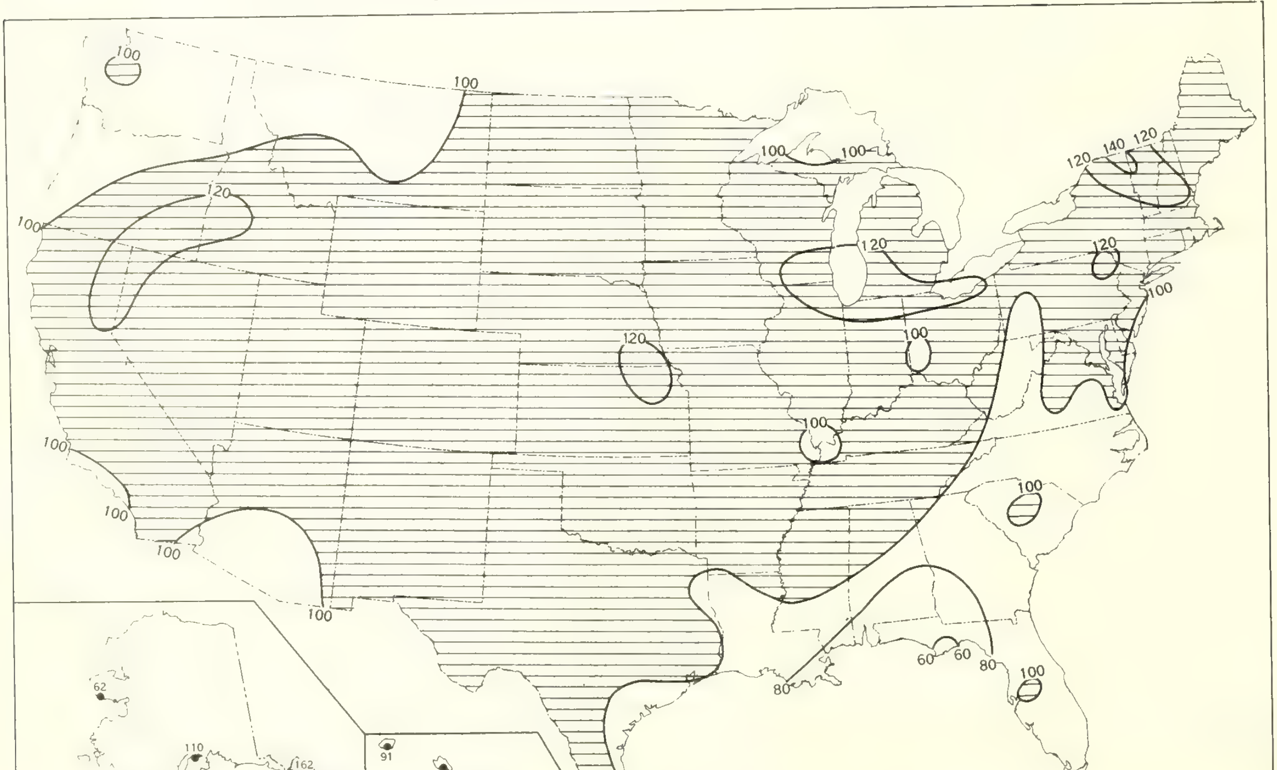
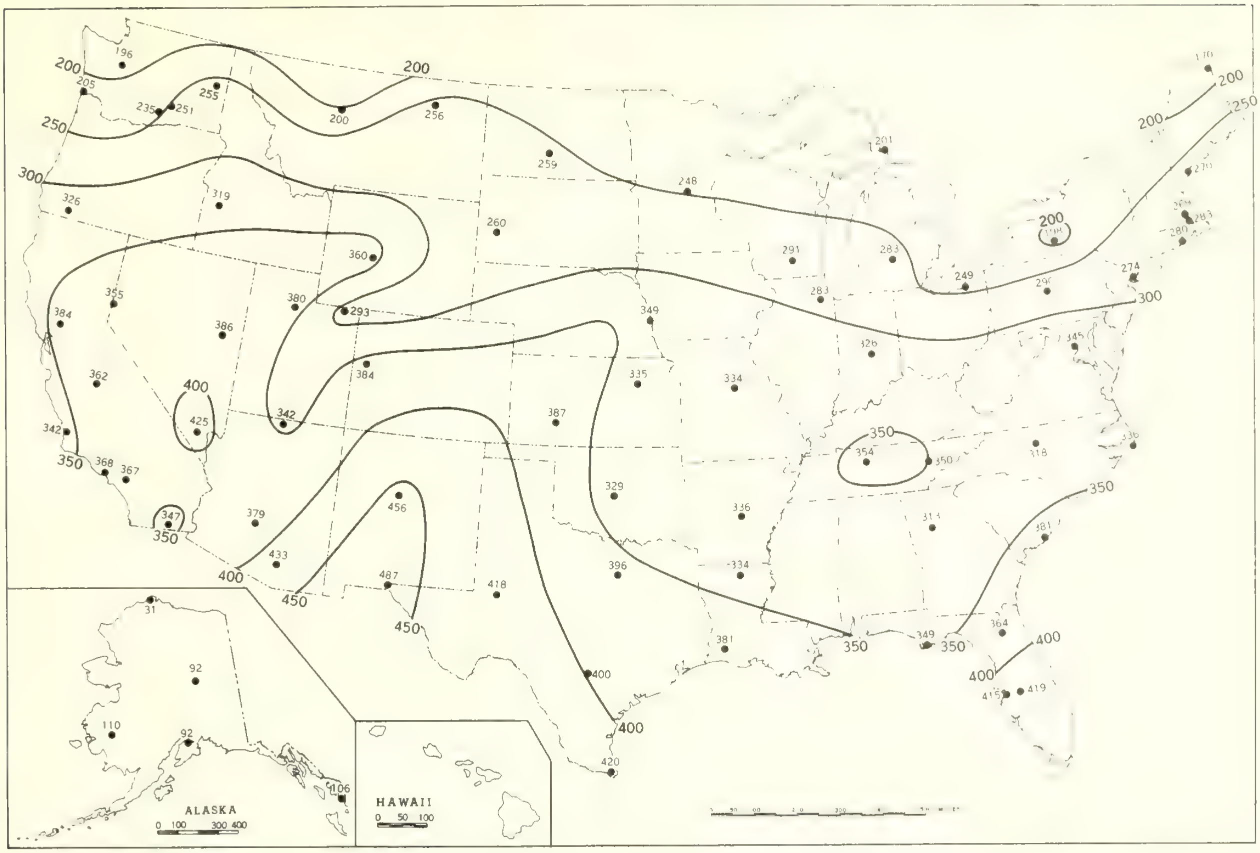


B. Percentage of Mean Monthly Sunshine, October 1966.

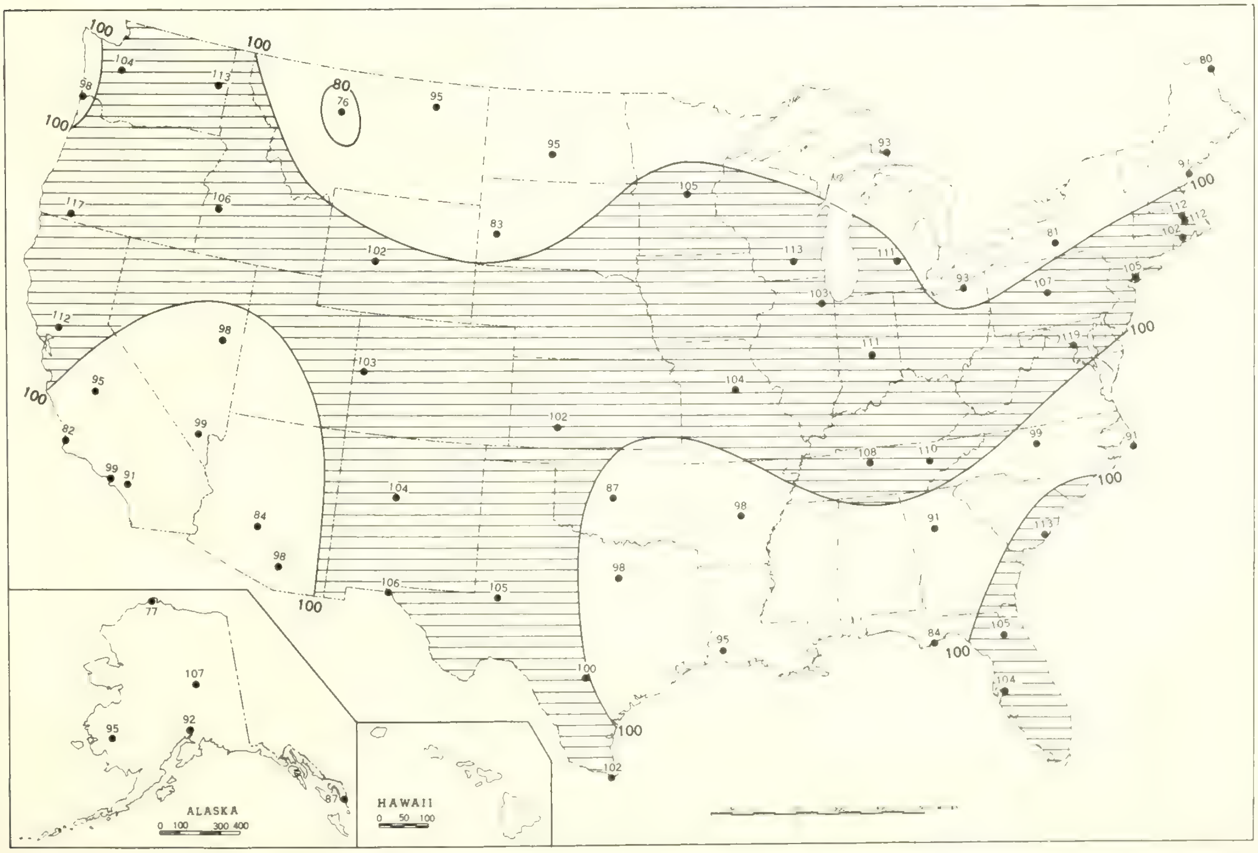


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, October 1966.

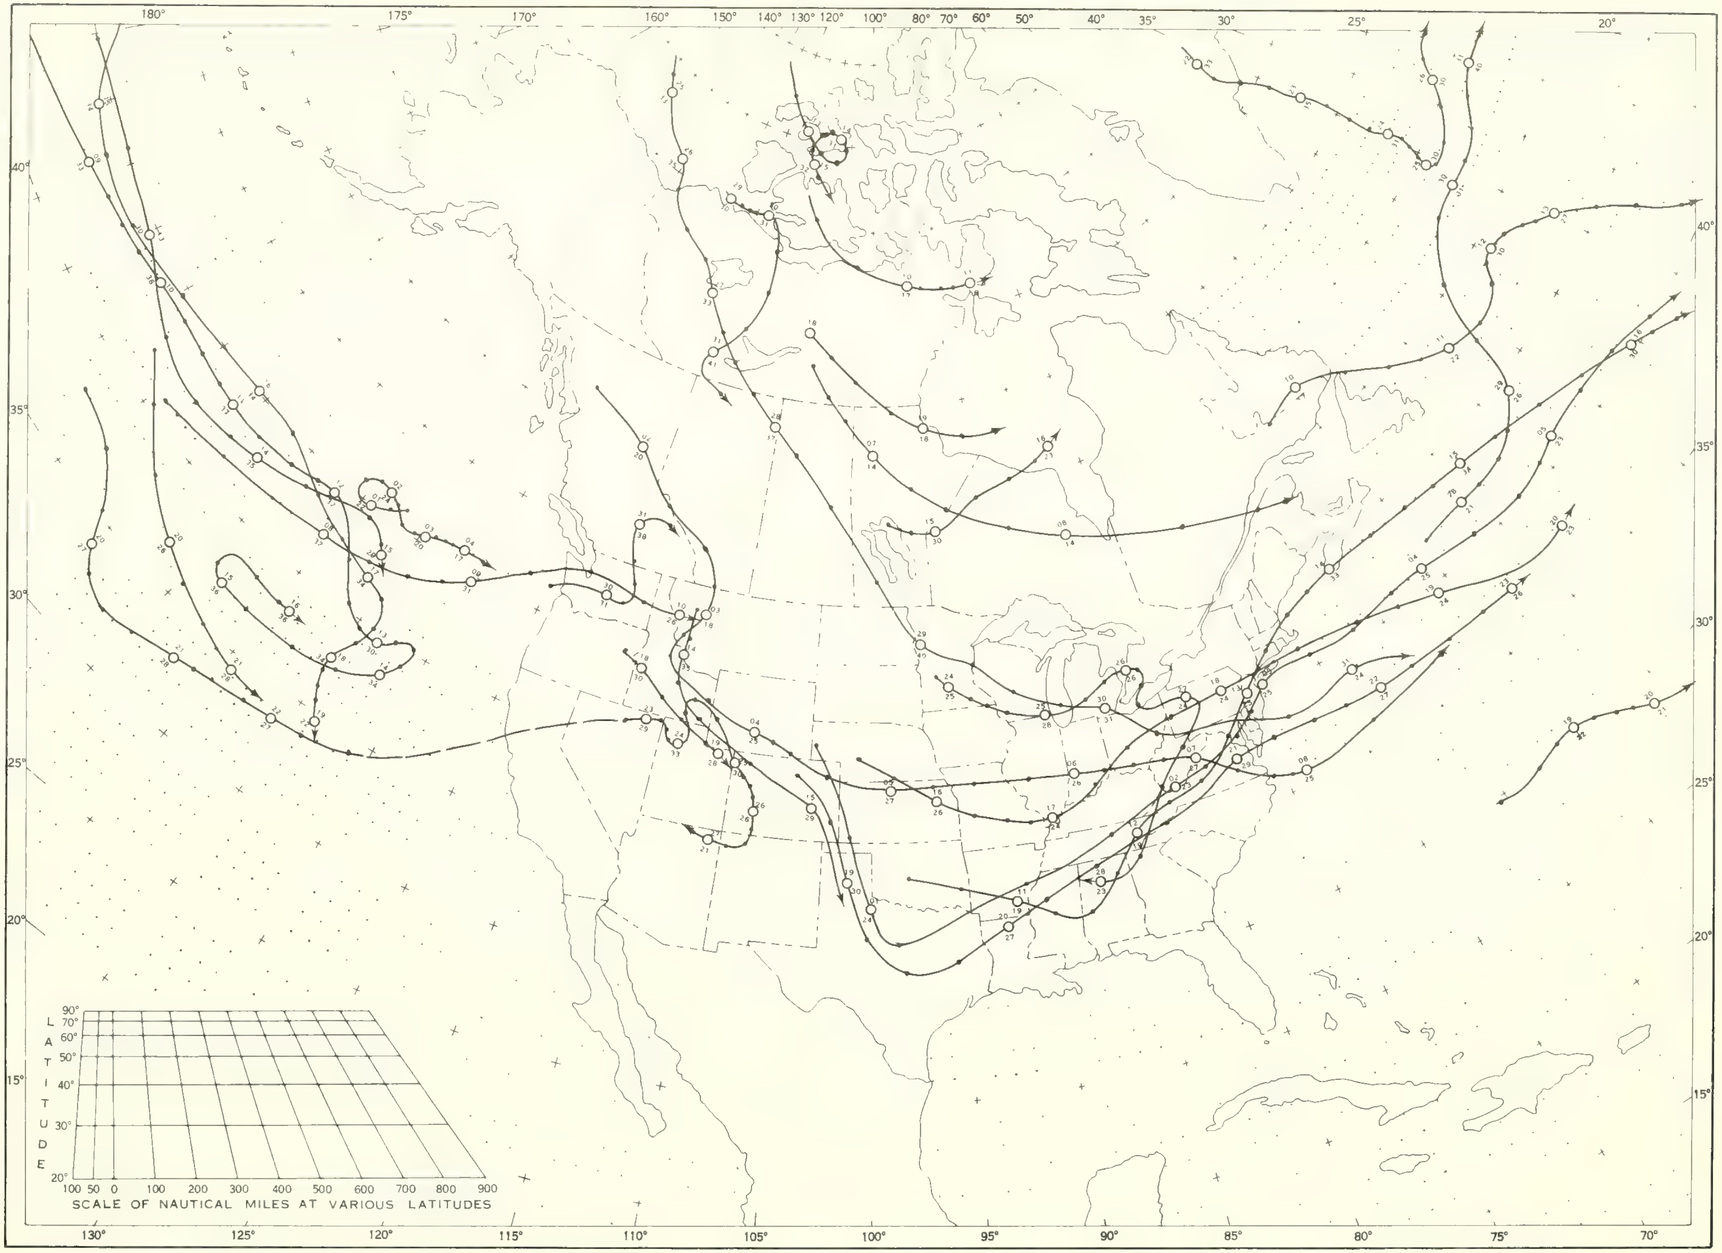


B. Percentage of Mean Daily Solar Radiation, October 1966.



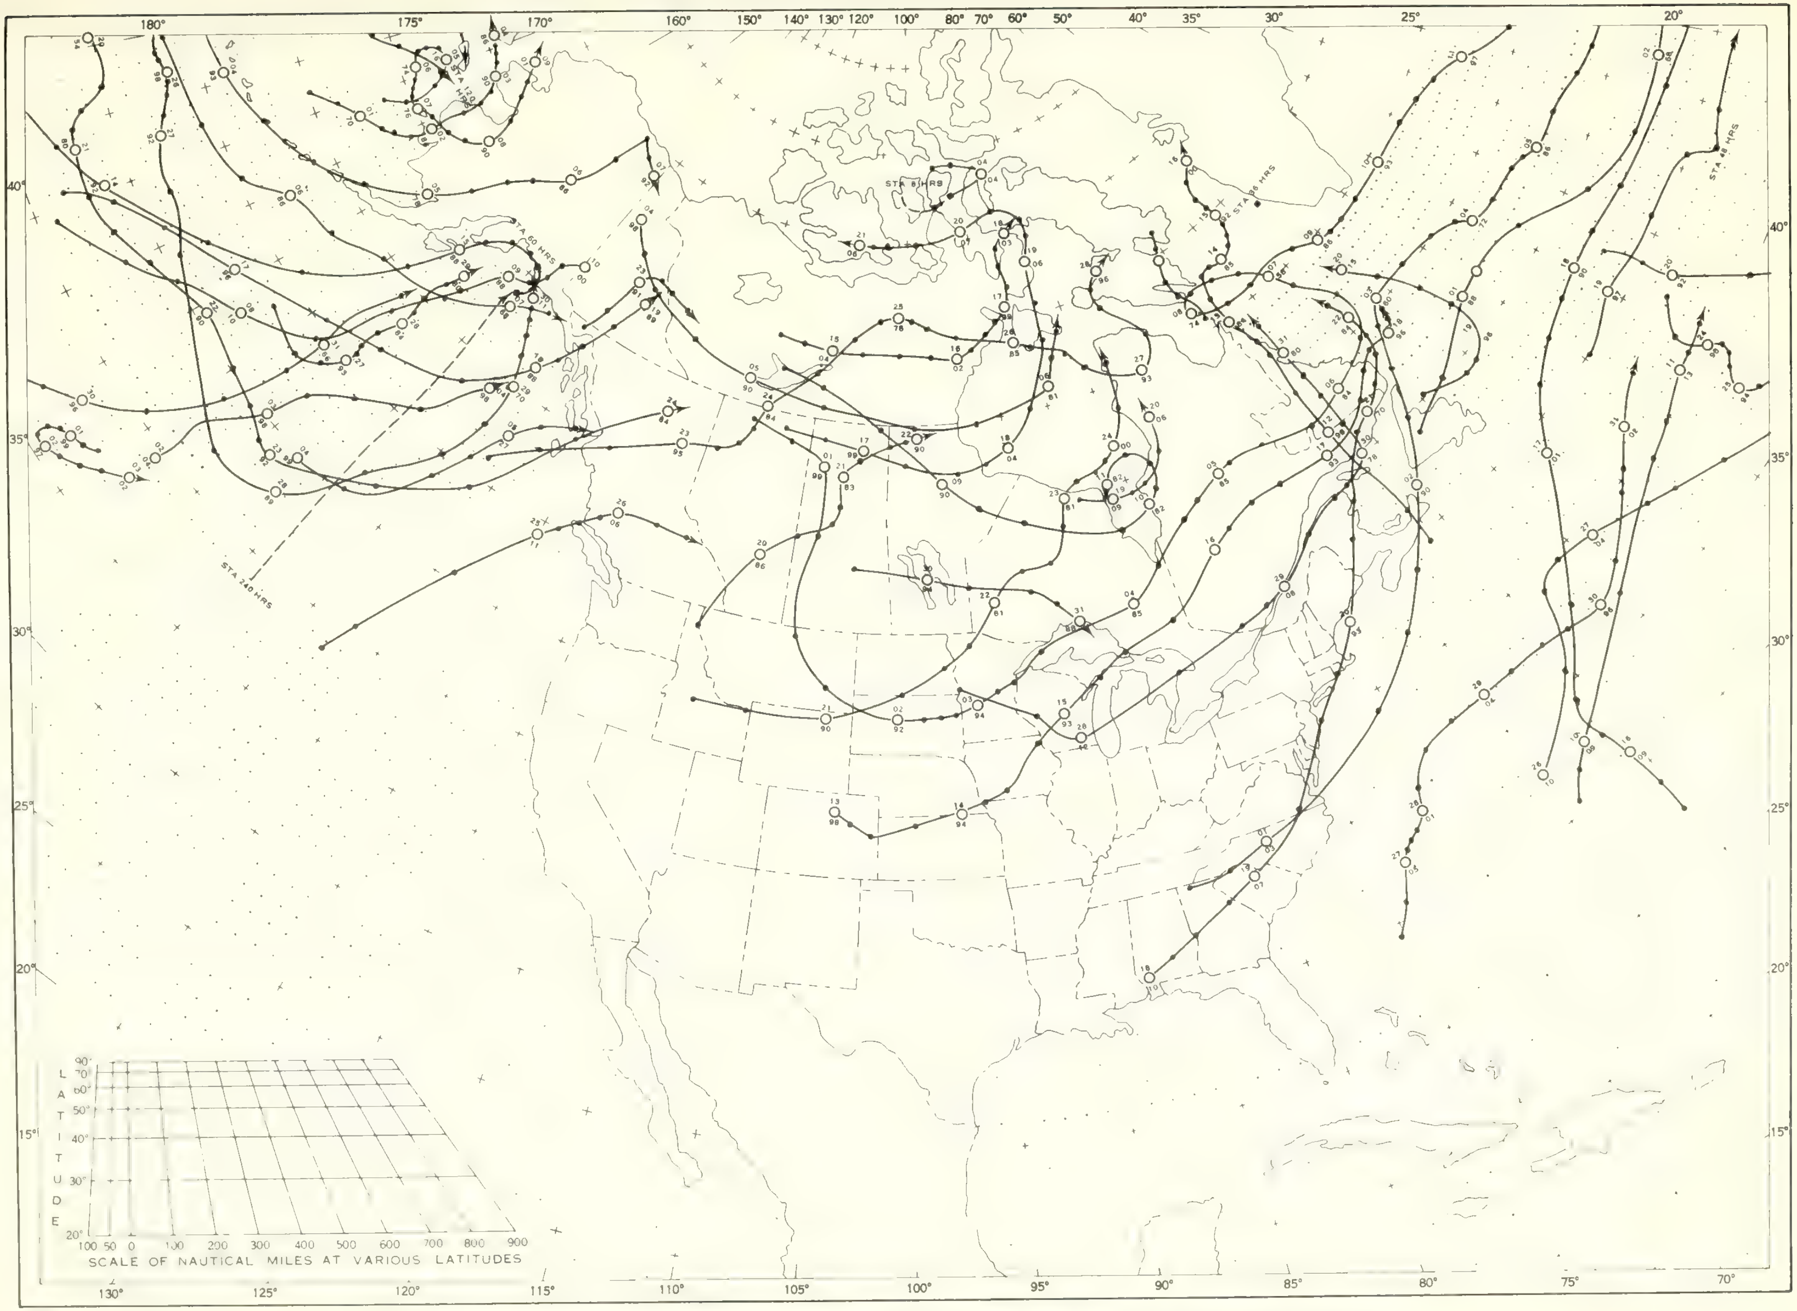
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, October 1966.



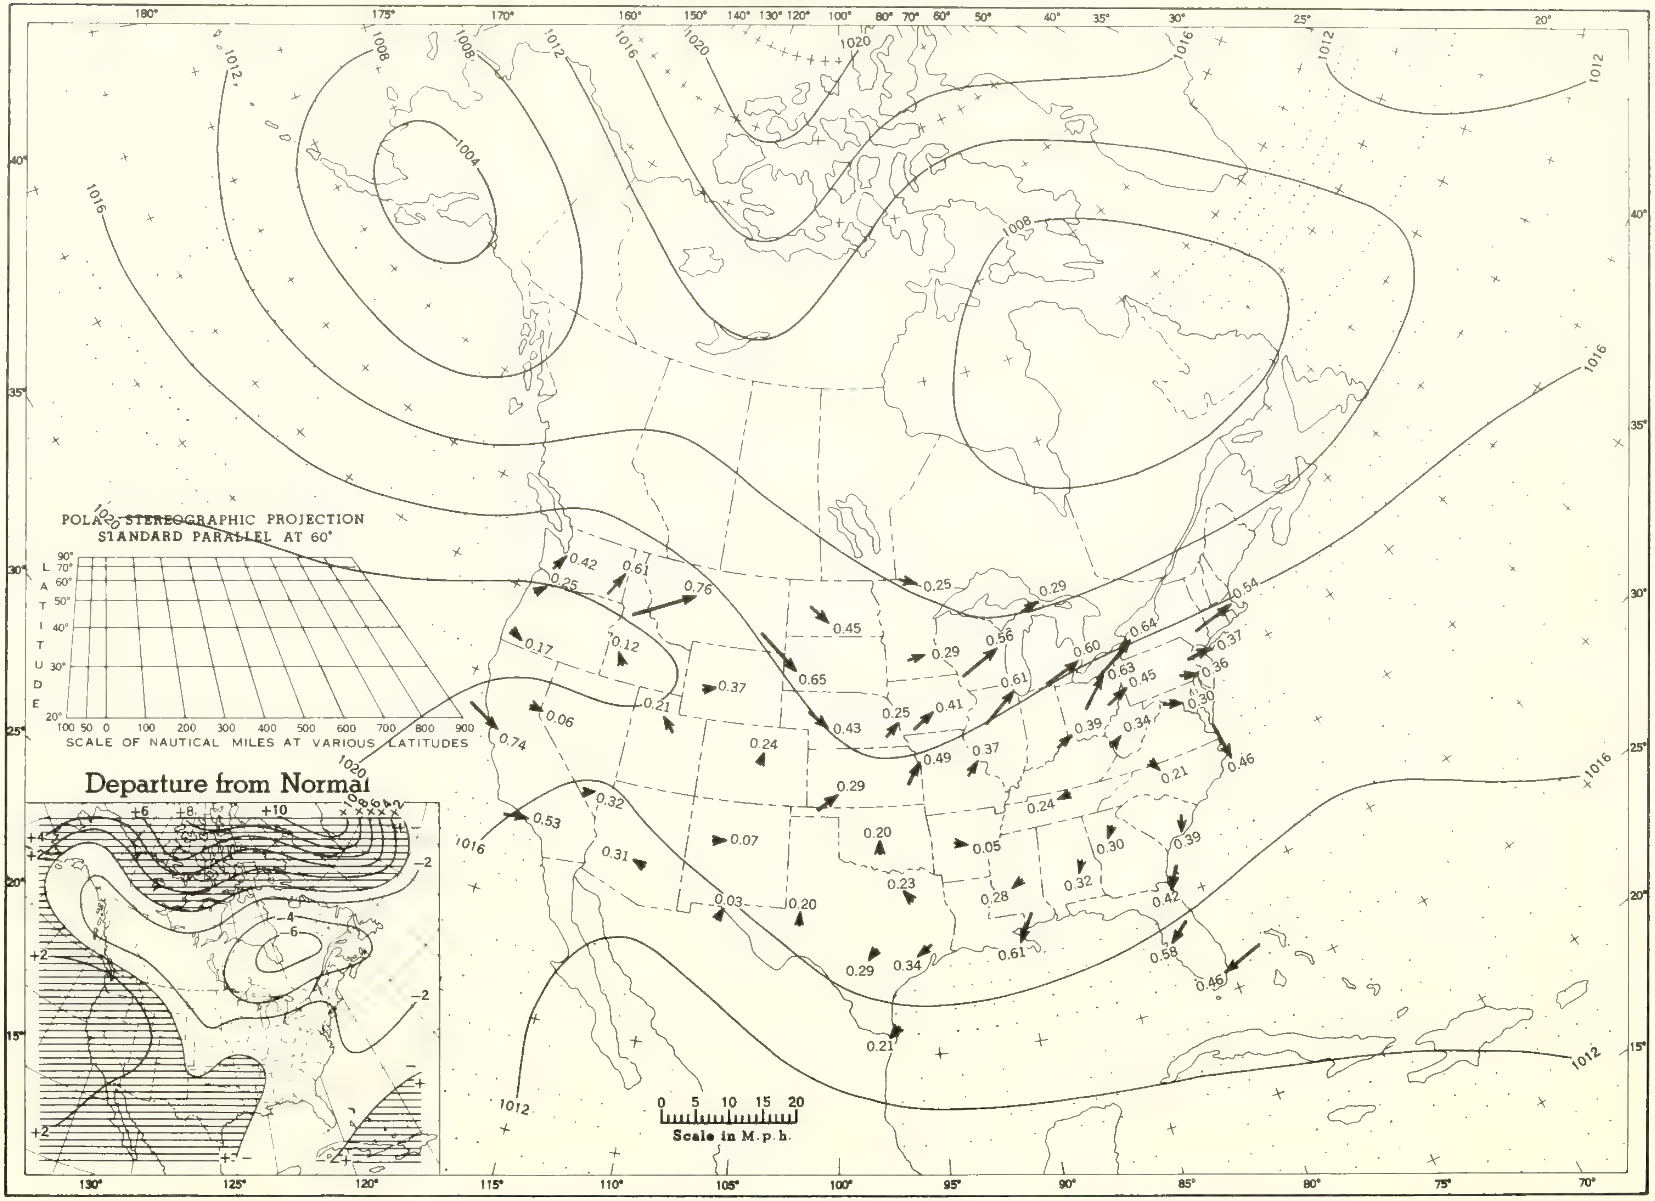
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, October 1966.



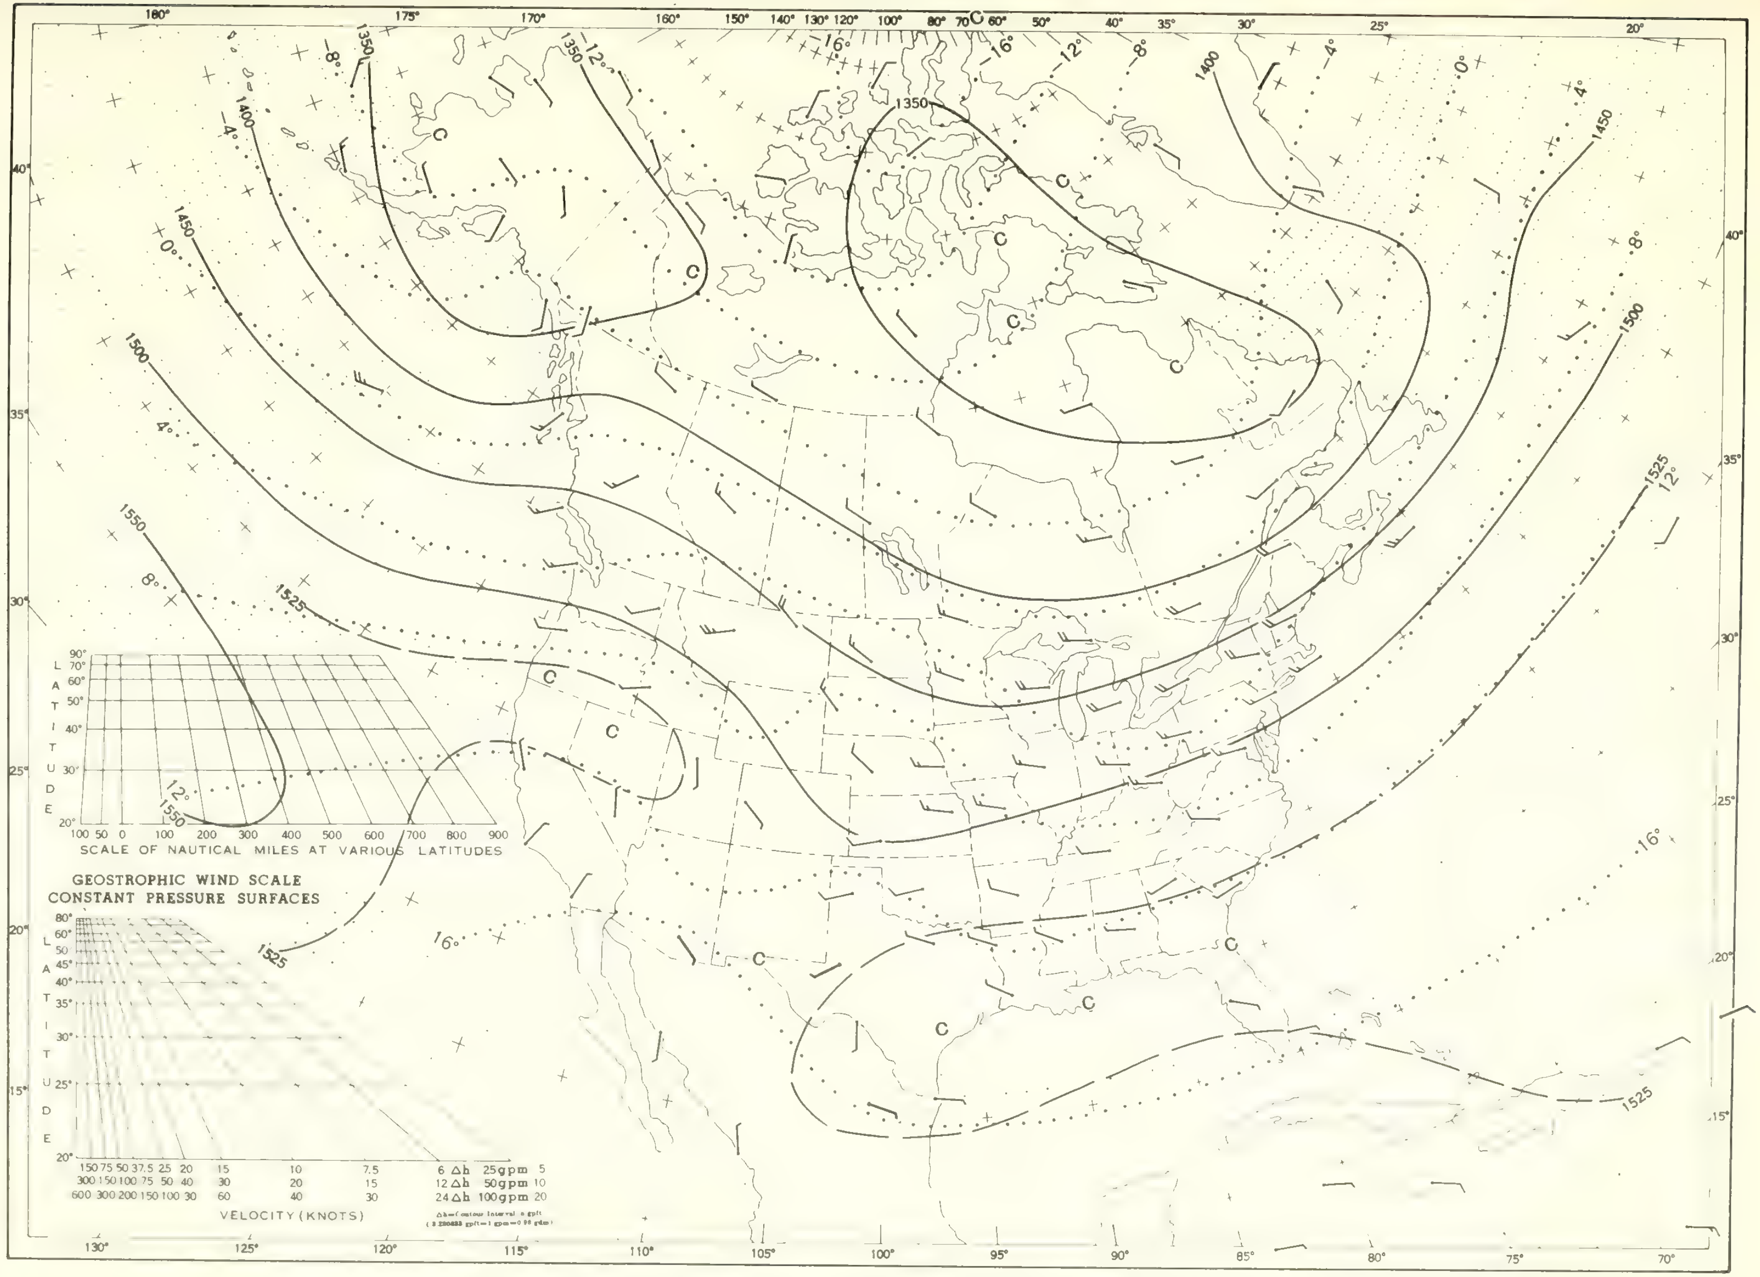
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, October 1966. Inset: Departure of Average Pressure (mb) from Normal, October 1966.



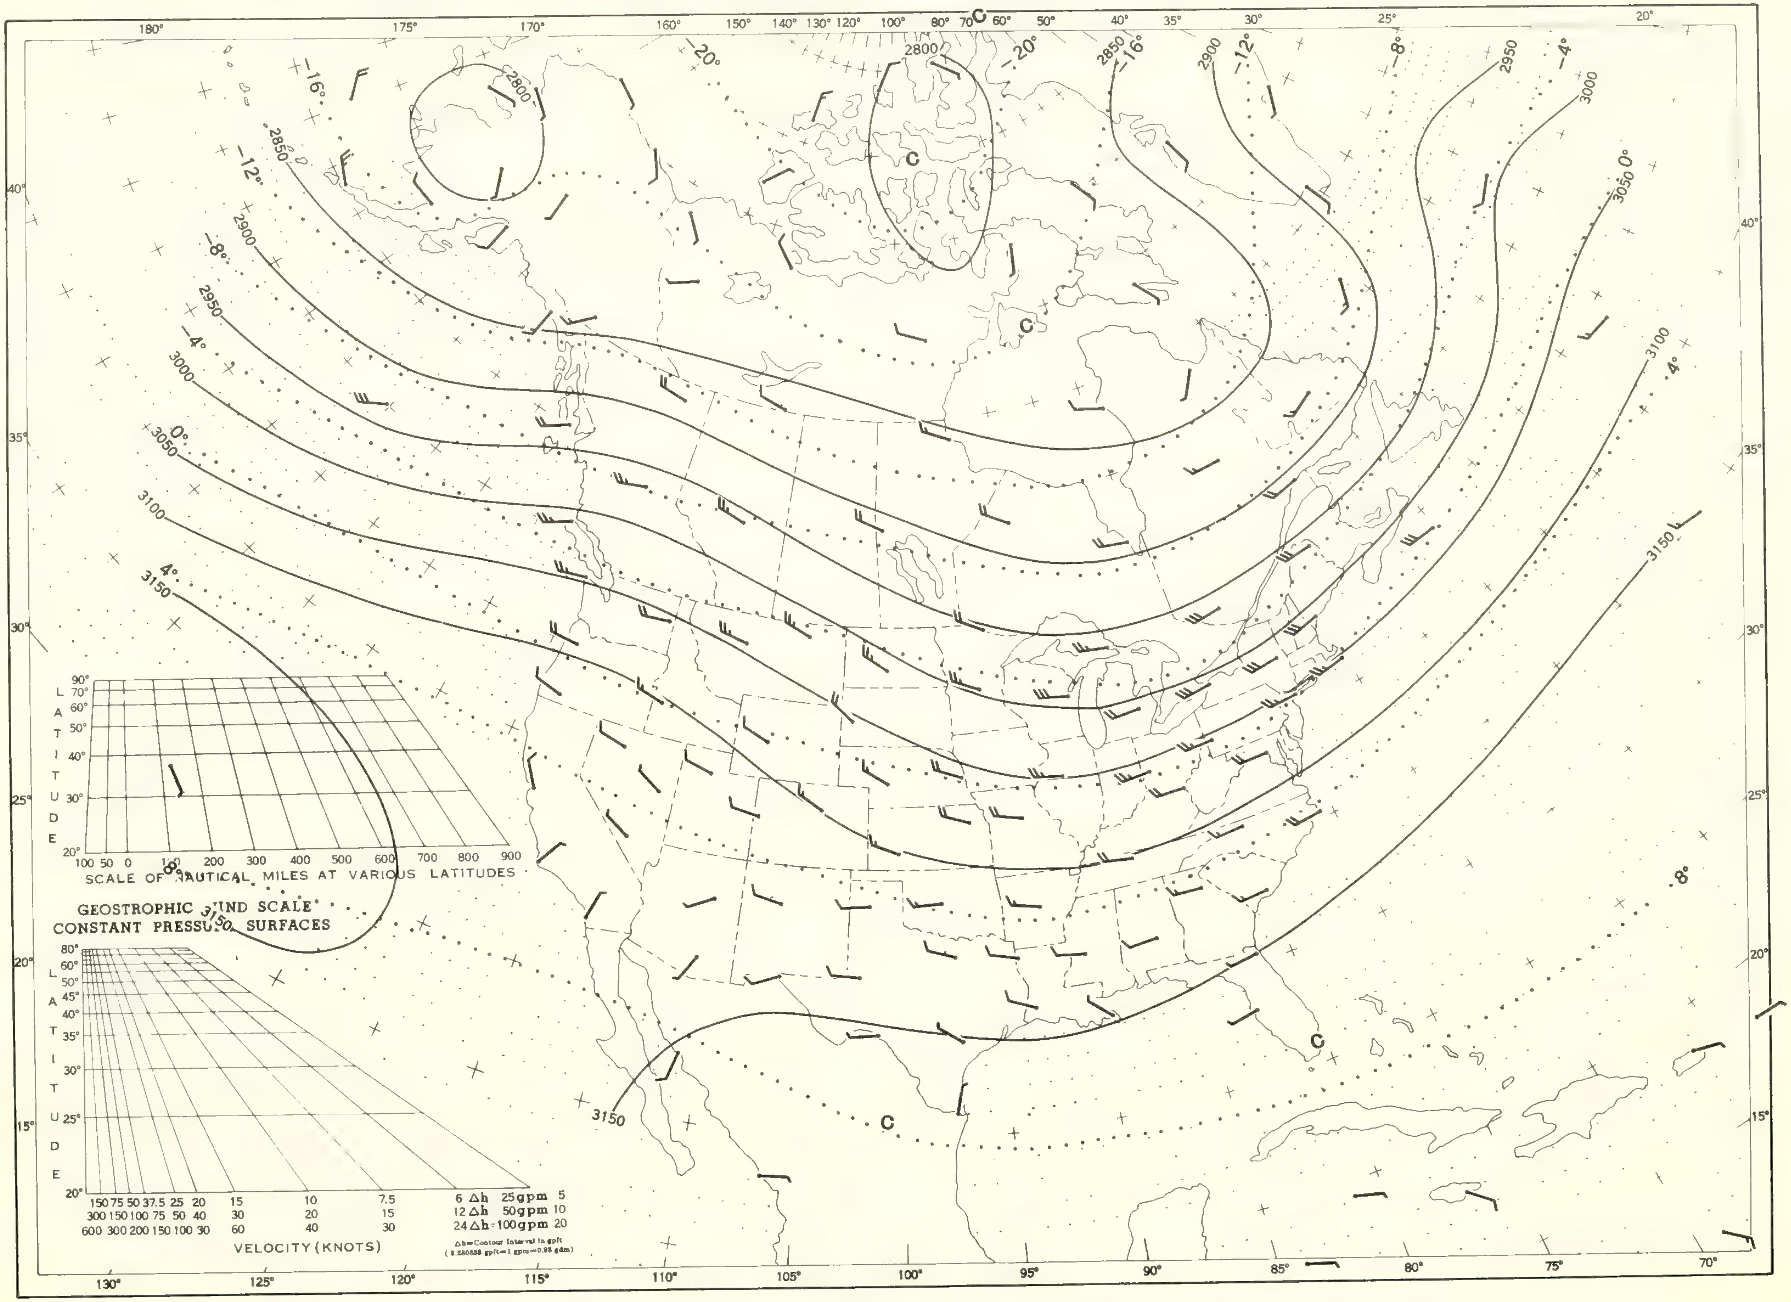
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, October 1966. Average Height and Temperature, and Resultant Winds.



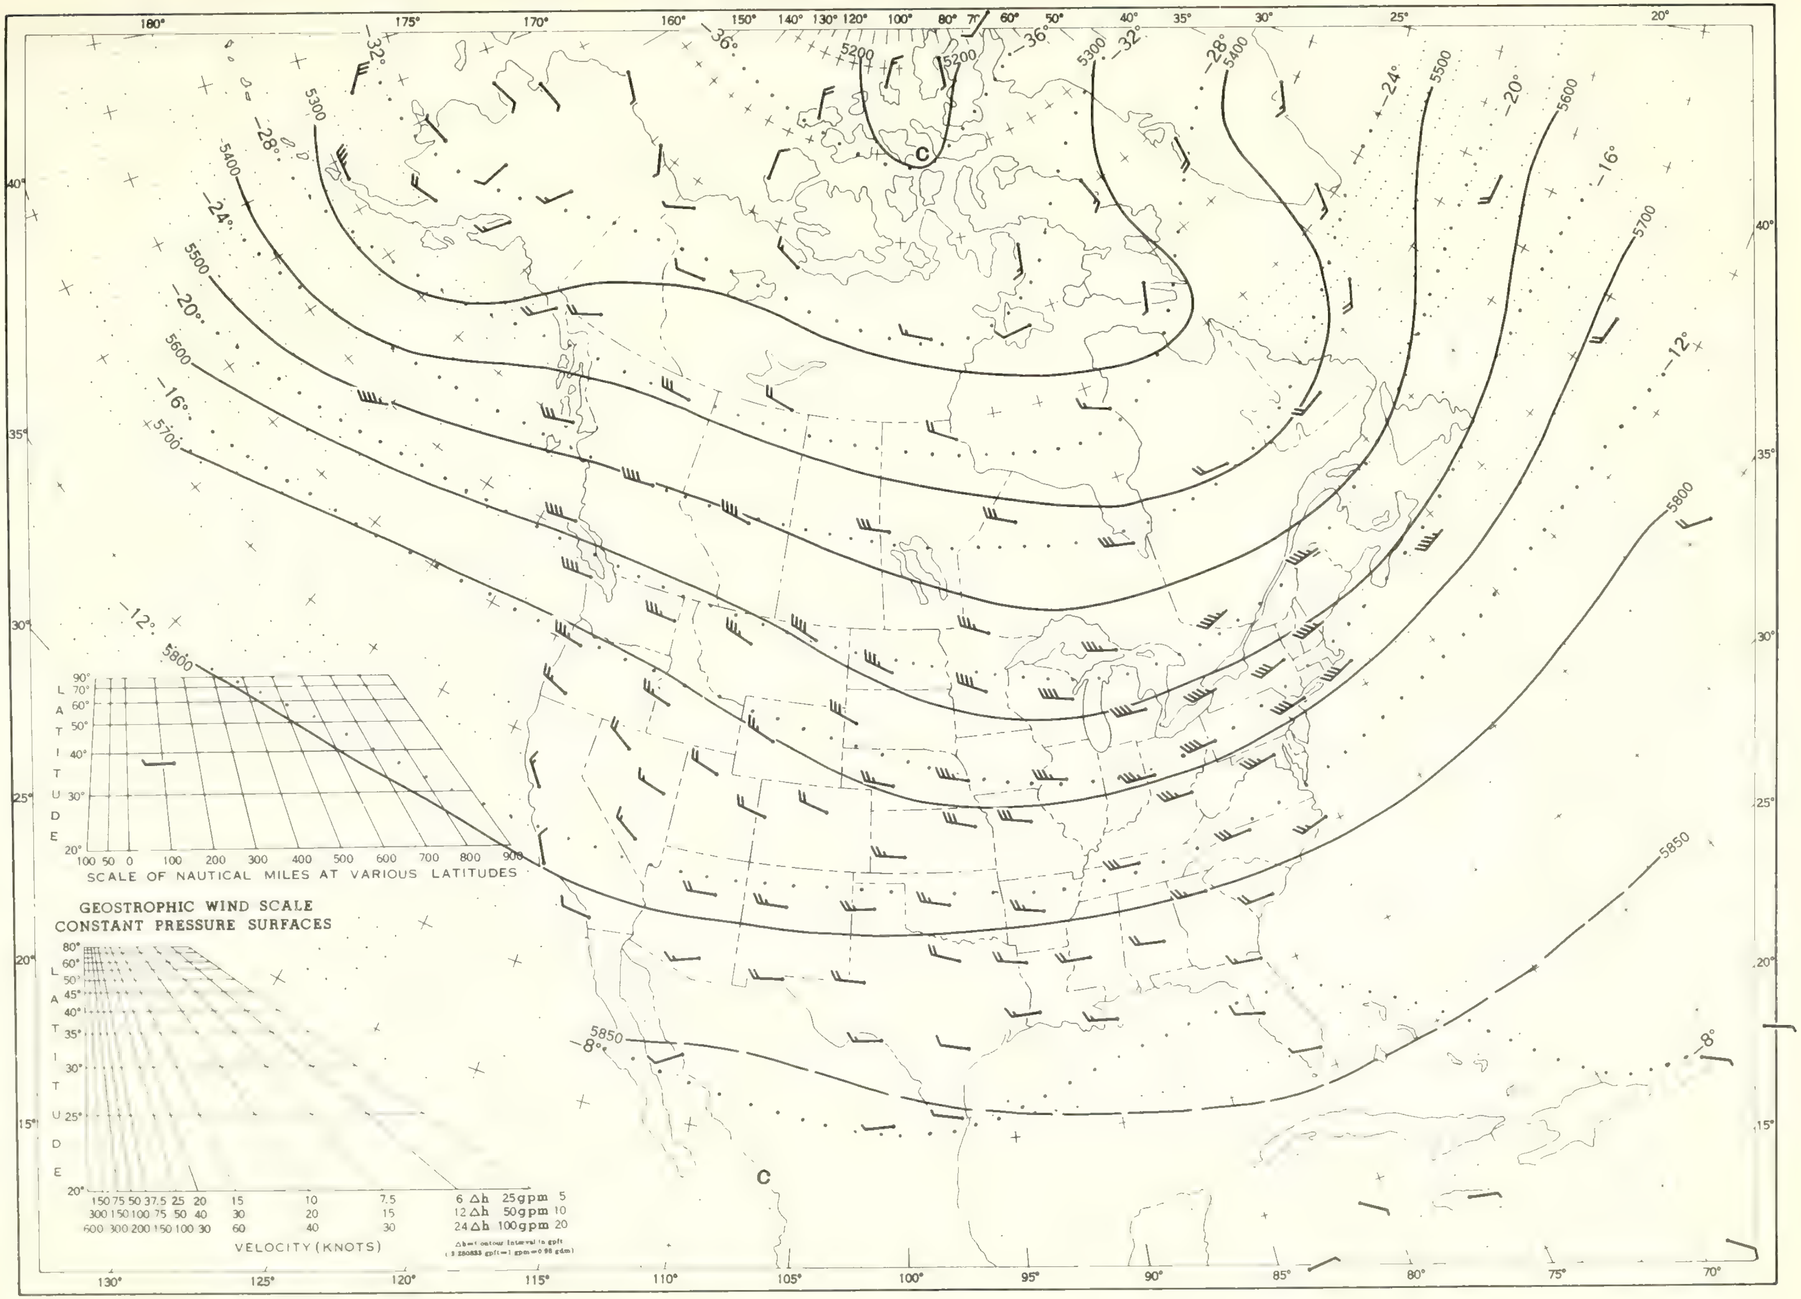
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, October 1966. Average Height and Temperature, and Resultant Winds.



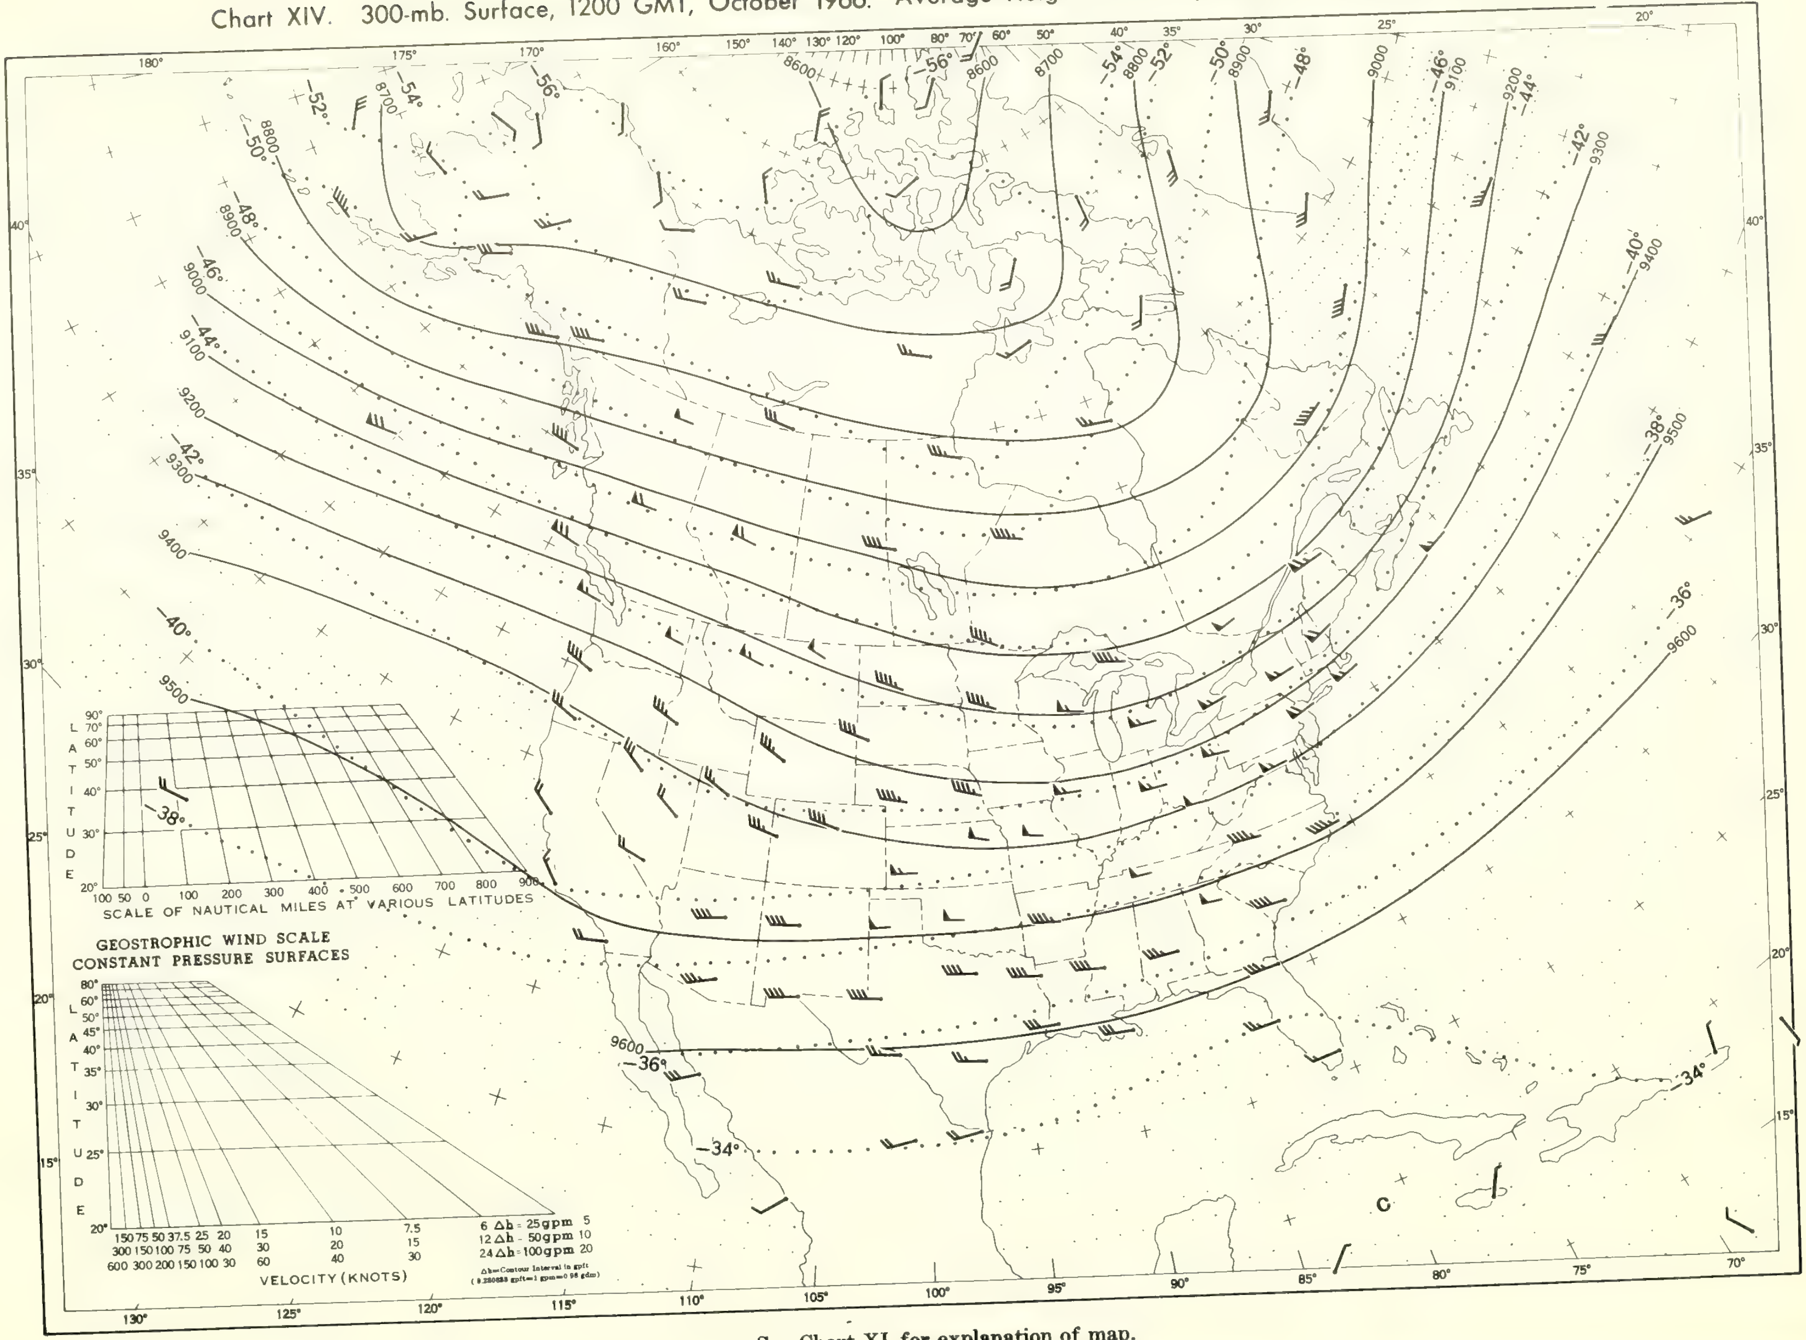
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, October 1966. Average Height and Temperature, and Resultant Winds.



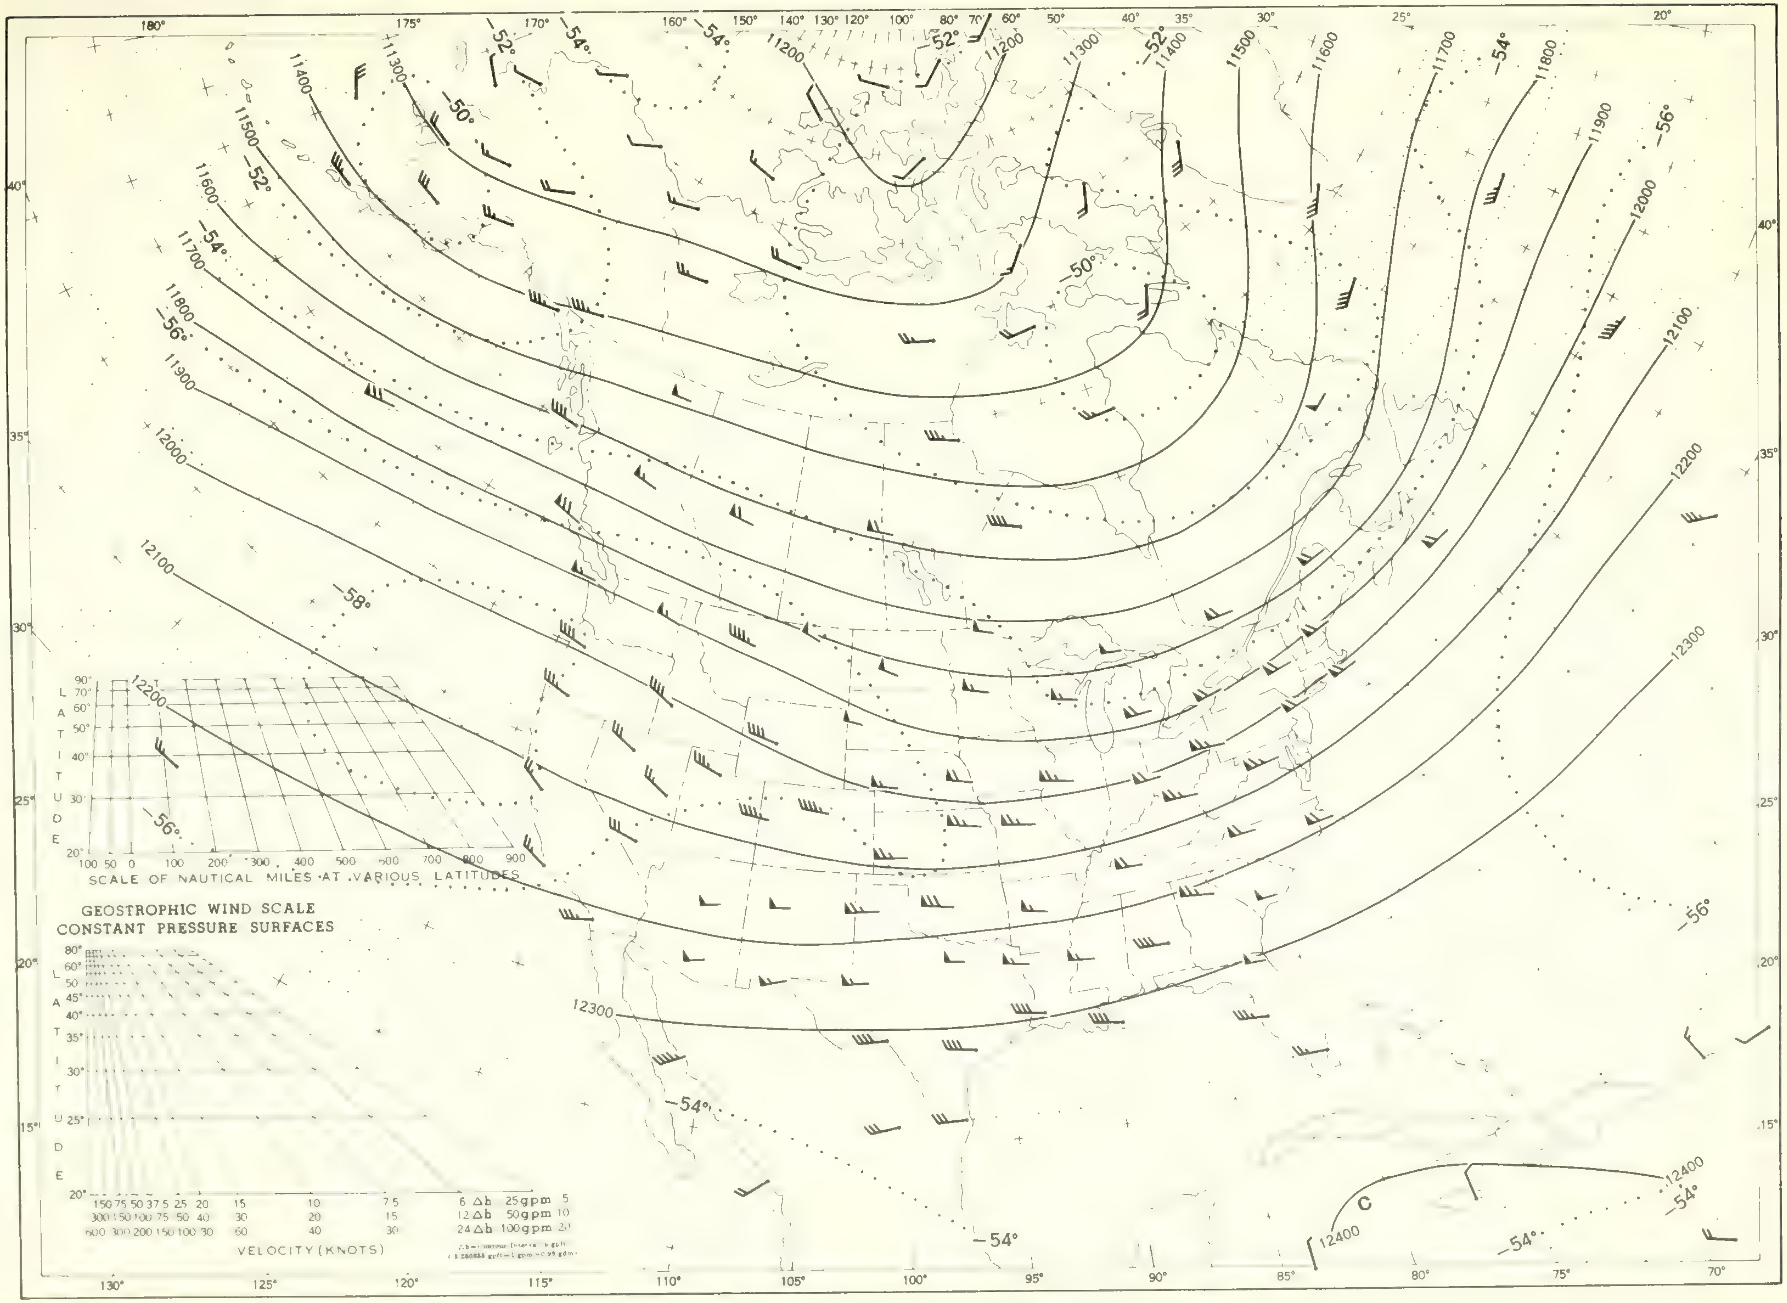
See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, October 1966. Average Height and Temperature, and Resultant Winds.



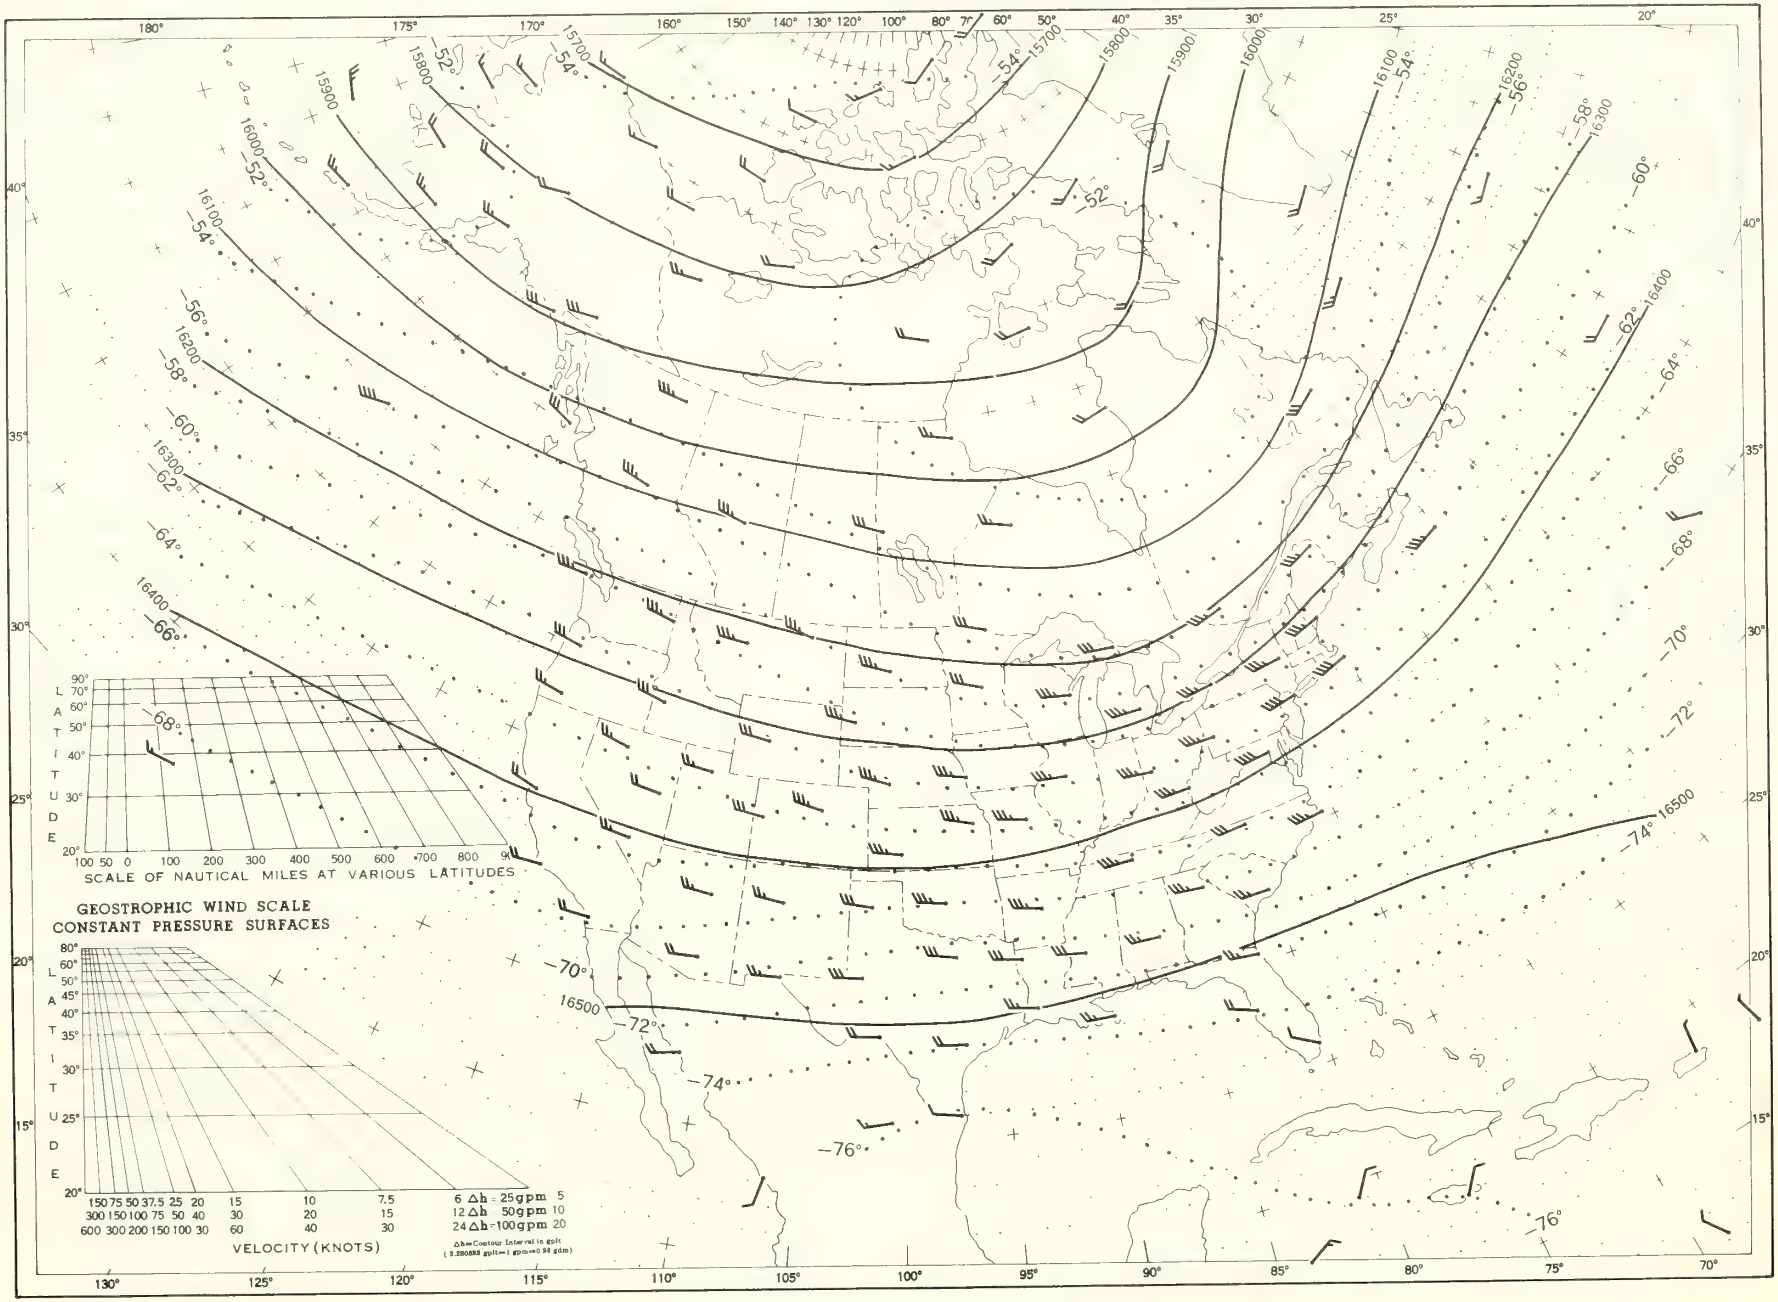
See Chart XI for explanation of map.

Chart XV. 200-mb. Surface, 1200 GMT, October 1966. Average Height and Temperature, and Resultant Winds.



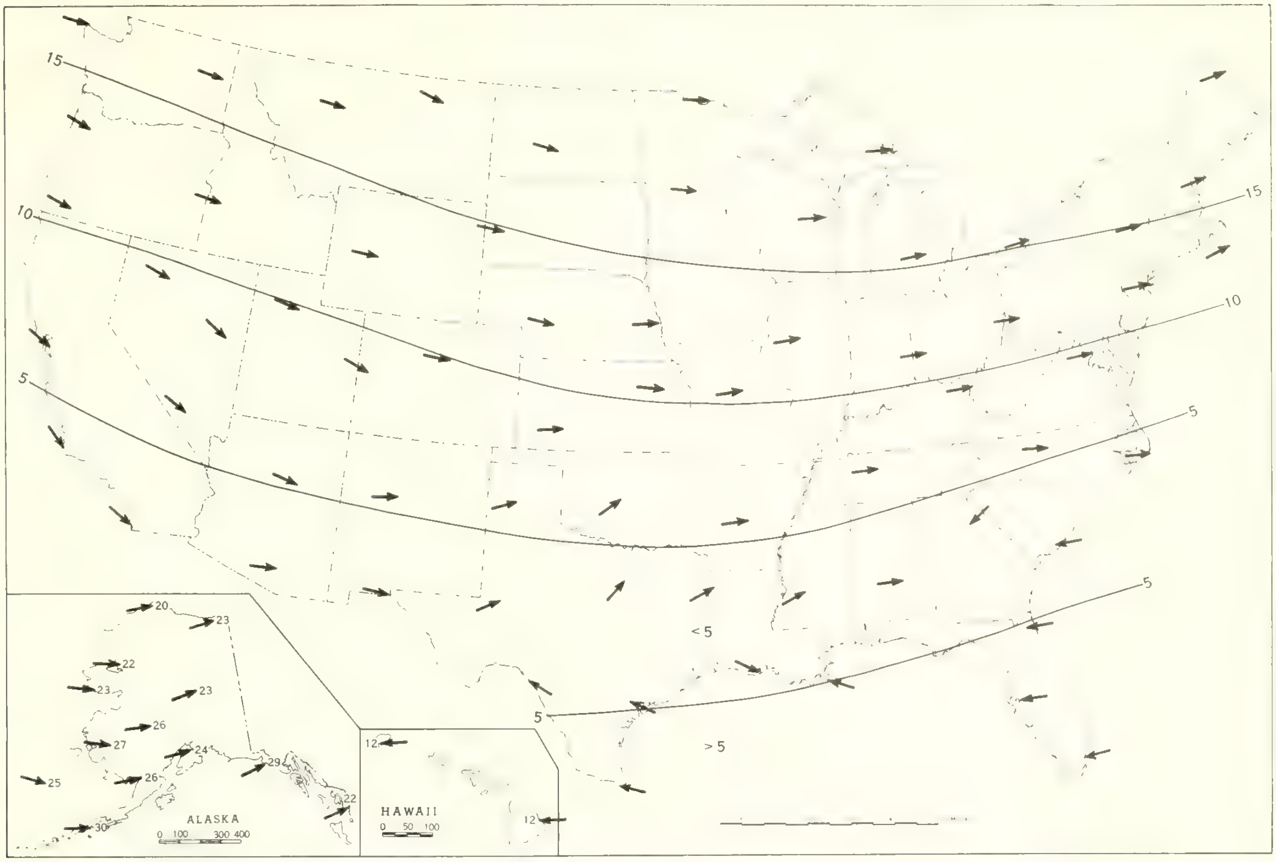
See Chart XI for explanation of map.

Chart XVI. 100-mb. Surface, 1200 GMT, October 1966. Average Height and Temperature, and Resultant Winds.

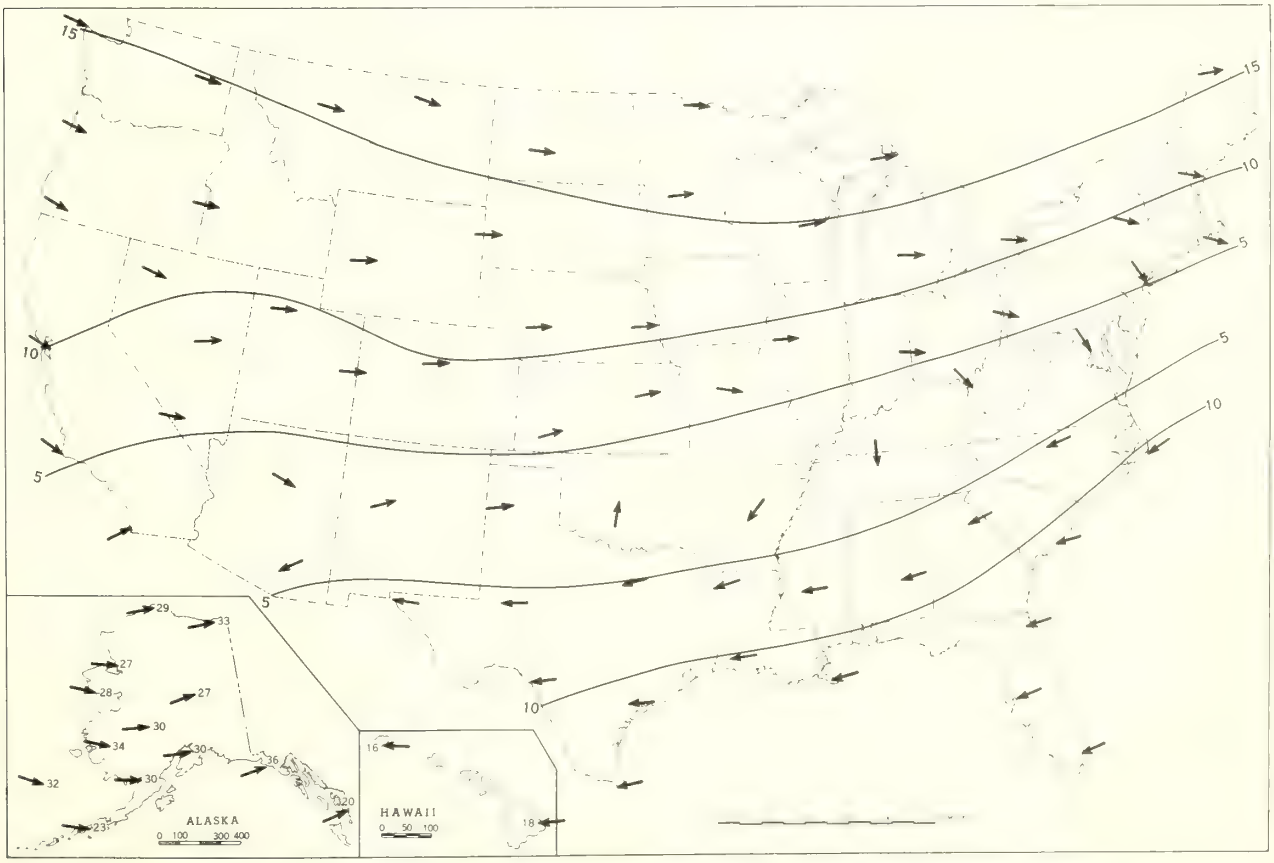


See Chart XI for explanation of map.

Chart XVII. A. 50-mb. Surface, 1200 GMT, October 1966. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, October 1966. Resultant Winds.



Wind speed (isotachs) in knots. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 11 NOVEMBER 1966

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Mild most areas.
2. Cold spells beginning and end of month east of Rockies.
3. Heavy precipitation much of Far West and Great Lakes region.
4. Very dry in Great Plains and along Gulf and south Atlantic coasts.
5. Heat wave southern California coast beginning of month.
6. Early midwestern snowstorm 1st-3d.
7. Heavy rains in Hawaii.
8. Heavy snowfall many northern areas.

TEMPERATURE.--Temperatures for November averaged below normal from the upper Great Lakes to the Rockies, and near to mostly above normal elsewhere. The month was as much as 8° below normal in the Dakotas where temperatures were below normal nearly all month. In scattered areas elsewhere across the Country monthly averages ranged up to 6° or more above normal. East of the Rockies cold waves occurred at the beginning and end of the month but the rest of the month was abnormally warm. West of the Rockies the first and last weeks were unusually warm with the second and third within a few degrees of normal. Extreme temperatures for the month in the 48 States ranged from -29° near Jordan, Mont., to 101° at 4 stations in California.

A cold wave east of the Rockies at the beginning of the month brought record low temperatures for so early in the season to the Midwest and South. Subzero temperatures were recorded as far south as Iowa and Nebraska and freezing extended southward to central Florida and almost to the southern tip of Texas. New Orleans, La., recorded 28° on the 3d, the lowest November reading there since 1871. In contrast, on the first day of the month temperatures at many stations rose to record high levels for November and for so late in the season along the southern half of the California coast, where Santa Ana conditions prevailed. Among these were San Francisco, 86°, Los Angeles, 101°, and San Diego, 97°.

The second week was extremely cold in the northern Great Plains where record low temperatures for so early in the season were recorded at numerous stations including Bismarck, N. Dak., -13° on the 11th and Minneapolis, Minn., -4° on the 12th. At the same time warm winds from the Gulf brought unseasonably high temperatures to the South and East, and temperatures were about normal in the Far West.

The third week was warmer than normal everywhere in the 48 States except in parts of the Northeast. In the central Rockies and lower Great Plains the week was 9° to 12° warmer than normal. The fourth week was abnormally mild except in California and some adjoining sections of nearby States and in the Florida Peninsula. St. Louis, Mo., recorded 74° on the 24th, the highest on record there for that date, while 64° at Helena, Mont., on the 20th was the highest for the date in 86 years. New York City's Central Park observed a record date high of 64° on the 25th.

PRECIPITATION.-- Precipitation was abnormally heavy in the Great Lakes region and Ohio Valley, eastern New England, Montana, northern Arizona, and the Pacific States. In the Great Plains, and Gulf and south Atlantic coastal areas, precipitation amounts for November were less than half of normal.

Most of the heavy precipitation in the Great Lakes area fell during the passage of strong storm systems near the beginning and end of the month, and particularly the latter, when more than 2 inches fell at a number of stations. Grand Rapids, Mich., reported 7.81 inches for the month; Columbia City, Ind., 8.48; Clinton, Ill., 5.72; and Chardon, Ohio, 7.28 inches. The Great Lakes storm at the beginning of the month also produced over 2 inches of moisture in New England, the heaviest of the month in that region. Monthly totals exceeded 8 inches at a number of stations in Maine, New Hampshire, and Massachusetts.

In the Far West monthly precipitation totals ranged up to 30.26 inches at Honeydew, Calif.; 19.58 at Brookings, Oreg.; and 19.40 inches at Spruce, Wash. Most of this heavy precipitation fell during intermittent periods of onshore winds caused by low pressure systems in the nearby Pacific, some of which moved inland. Mount Shasta, Calif., measured 11.32 inches for the month, the third greatest total for November there since 1888, ending the period of deficient precipitation that had existed since February 1966. At Red Bluff, Calif., 7.42 inches of rain fell during the month, the third greatest for a November of record, and the most since 1904. This ended the worst drought in the area since the beginning of records in 1872.

The month was extremely dry in the southern Great Plains. At San Antonio, Tex., only a trace was observed during November for the first time since 1903, and 153 other stations in the State recorded none at all. The period January through November was the driest of record at Concordia, Kans., since 1885 and at Topeka, Kans., since 1778. In Colorado, New Mexico, and most of the central and southern Great Plains, soil moisture conditions were becoming critical at the end of the month and small grain conditions were declining. Ranges in these areas continued dry and short.

A Kona storm brought 8.84 inches of rain to Honolulu, Hawaii, during the first 8 days of the month. These storms are unusual this time of the year.

SNOWFALL.--A notable snowstorm for so early in the season occurred on the 2d and 3d in a belt that extended from the lower Great Lakes to the central Gulf coast. Mobile, Ala., reported snow pellets on the 2d, the earliest snowfall there on record. Huntsville, Ala., recorded 4 inches; Nashville, Tenn., 7.2; Louisville, Ky., 13.1; Columbus, Ohio, 10.4; and Grand Rapids, Mich., 7.6 inches -- record amounts for so early in the season at all 5 stations. Up to 15 inches were reported in central Kentucky. In south Buffalo, N. Y., and nearby suburbs accumulations ranged up to 2 feet although only about

6 inches fell at the Airport; this snow all melted by the 8th.

Generous snowfall occurred in California's Sierras and from the Cascades to the western slopes of the Rockies during the first 2 weeks of December, with lighter amounts in these areas the 3d week and in the Sierras the last week. Winslow, Ariz., measured 4.8 inches on the 8th and 9th, a record 24-hour amount for November. Some heavy snow fell in the northern Rockies and areas eastward at the end of the month. Alpena, Mich., received 16.1 inches of snow on 28-29th, a record for 24 hours, and east of Cleveland, Ohio, 8 to 12 inches of snow fell on the 28th and 29th.

Monthly totals, as usual, were greatest in the Cascade-Sierra Nevada Mountains where some stations reported over 50 inches. In Upper Michigan, Marquette reported 28 inches, about 12 inches more than the usual fall for November, and Muskegon, Mich., had 20.3 inches - the second greatest November total of record.

DESTRUCTIVE STORMS AND UNUSUAL PHENOMENA.--Thundersqualls and a few tornadoes occurred in the South during the second week. On the 7th a small tornado was reported about 4 miles east and northeast of the Los Angeles International Airport, and while there were no casualties there was considerable damage. During a cold front passage on the 1st, small tornadoes were reported near Raleigh, N. C., and Richmond, Va.

During the fourth week a polar High lingered over the Atlantic coast and smog developed in several cities. Air pollution reached dangerous levels in New York City, as a low level inversion formed in the stagnant air. The threat continued for several days until showers and eastward movement of the High cleared the air by the 27th.

During the closing days of the month hurricane force winds over Lake Huron destroyed an ore carrier with loss of all the crew except one.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or with a measurable amount the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

V Sun below horizon November 19 - 30, inclusive.
X Sun below horizon November 24 - 30, inclusive.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or with a measurable amount the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.
A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

V Sun below horizon November 19 - 30, inclusive.
X Sun below horizon November 24 - 30, inclusive.

° Includes crop damage
C Crop damage
R Rain
N No report received by printing deadline

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the U. S. Weather Bureau monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

NOVEMBER 1966

Elmer R. Nelson, Office of Hydrology

Record flooding occurred on the Piscataquis River and moderate flooding on the Kennebec and Androscoggin Rivers in Maine during November.

A flash flood in the Waimea area of Hawaii on November 20 caused 2 deaths by drowning. Heavy rains in the Waikii area caused a normally dry stream to overflow as much as 5 feet.

ST. LAWRENCE DRAINAGE

Lake Erie.--Heavy rain and wet snow occurred over the Sandusky Basin in Ohio on the 1st and 2d. This was followed by frequent light rains and snowmelt through the 11th. Runoff from the rain and snowmelt caused the Sandusky River to rise to near bankfull stage.

ATLANTIC SLOPE DRAINAGE

Moderate flooding occurred on the Kennebec and Androscoggin Rivers in Maine from the 3d through the 5th. Flash flooding resulted on many small streams in Maine and scattered sections of upper New Hampshire. A record-breaking flood occurred on the Piscataquis River on the 3d and 4th. A maximum flow of 22,800 c.f.s. occurred on the 4th on the Piscataquis River near Dover-Foxcroft, Maine. The previous maximum flow at this point was 21,500 c.f.s. on April 29, 1923. A maximum flow of 60,100 c.f.s. occurred on the 4th on the Piscataquis near Medford, Maine. The previous maximum flow was 50,200 c.f.s. on March 20, 1936. Minor lowland flooding and minor flash flooding occurred in parts of upper New Hampshire. Overall flood damage in Maine was estimated in the tens of thousands of dollars. There was no loss of life. This flooding was due to heavy rainfall on the 2d and 3d. Some local reports of rainfall in Maine during this storm ran as high as 5 inches to in excess of 6 inches. The total damages from flooding in Maine were estimated at about $500,000. The State of New Hampshire reported no flood losses.

Extremely heavy showers of short duration (about 30 minutes) in central and northern New Jersey on the 28th caused considerable storm drainage flooding. No stream flooding was reported.

MISSISSIPPI SYSTEM

Missouri Basin.--Moderate drought conditions continued in the upper portion of the Missouri Basin during November. The January through October total precipitation at Helena, Mont., was 4.80 inches. This was the least precipitation recorded at Helena in 86 years of record. The heaviest rain in the lower portion occurred on the 24th and was localized near the mouth of the Kansas River. Local amounts of near one-half inch to over an inch were reported. There were no significant rises on the Missouri River or tributaries.

Releases from upstream reservoirs were reduced for the winter season on the 23d with the navigation season ending at the end of the month.

Ohio Basin.--Heavy rain and wet snow on the 1st and 2d followed by frequent light rains and snowmelt through the 11th caused the Scioto River and tributaries in Ohio to rise to near bankfull stage from the 9th through the 11th. Another moderate rise developed over the upper Scioto on the 27th and 28th following moderate to heavy rains.

Heavy rains on the 26th and 27th caused minor flooding on the lower White River at Elliston, Ind., on the 29th. Flood stage was reached, but not exceeded, at Elliston, Ind., on the 28th and 29th.

Arkansas Basin.--Rainfall in the Arkansas Basin during November was much below normal. More than 20 stations reported no measurable precipitation during the month. The average stage on the Cimarron River at Ralston, Okla., was 1.5 feet, which is the lowest on record for November. The normal mean stage for Ralston is 4.0 feet.

WEST GULF OF MEXICO DRAINAGE

Heavy rain on the 11th caused light flooding on the Calcasieu River at Hineston and Oakdale, La., on the 13th and at Old Town Bay, La., on the 17th and 18th.

PACIFIC SLOPE DRAINAGE

Heavy rain on the 7th set a new record at Los Angeles, Calif., for November. On that date, 3.85 inches of rain was recorded. The Los Angeles River, normally a dry river, rose rapidly causing strong currents to overturn a canoe and drown its occupant.

A minor rise occurred on streams in the Sacramento Basin during the third week in November. Brief overflow occurred at Tisdale Weir and Sutter Bypass on the 22d. By the end of the month, the streams started to rise again as a new series of storms started moving toward California.

Heavy precipitation from the 10th to the 16th caused the first substantial rise for the season in the Columbia Basin. Precipitation amounts during the period ranged from 4 inches at valley locations to 7 inches at mid-Cascade elevations. This series of storms accounted for much of the above-average November totals west of the Cascades. Most of the Willamette tributaries rose 4 to 5 feet on the 11th and 12th. This was followed by a larger rise on the 14th-16th. During this rise the Santiam River at Jefferson, Oreg., and the Willamette River at Harrisburg, Oreg., reached near bankfull stages. The flow of the Columbia River at Bonneville Dam remained almost constant throughout the month at 110,000 c.f.s. The Columbia River at Vancouver, Wash., averaged 3.4 feet during November. This was 2.7 feet below the long-term normal.

Note: All observations scheduled at 1200, G C T Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes "Number of observations" refers to those of dynamic height only Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations Relative humidity averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i e, elevation angles less than 6° above the horizon, or any obstruction above the horizon

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available

Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of 98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G. C. T.

					No observations due to cloudiness				

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (midnight to midnight) at Huntley, Mont. NOVEMBER 1966

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	110	42	62	42	36	-19	18	-4	-49	13	51	57	15	42	67	13	-12	46	59	56	47	45	72	-3	-27	16	24	83	42	45		330

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Huntley Exp. Station. The instrument with which they were measured has not been checked by the Weather Bureau.

TOTAL OZONE DATA

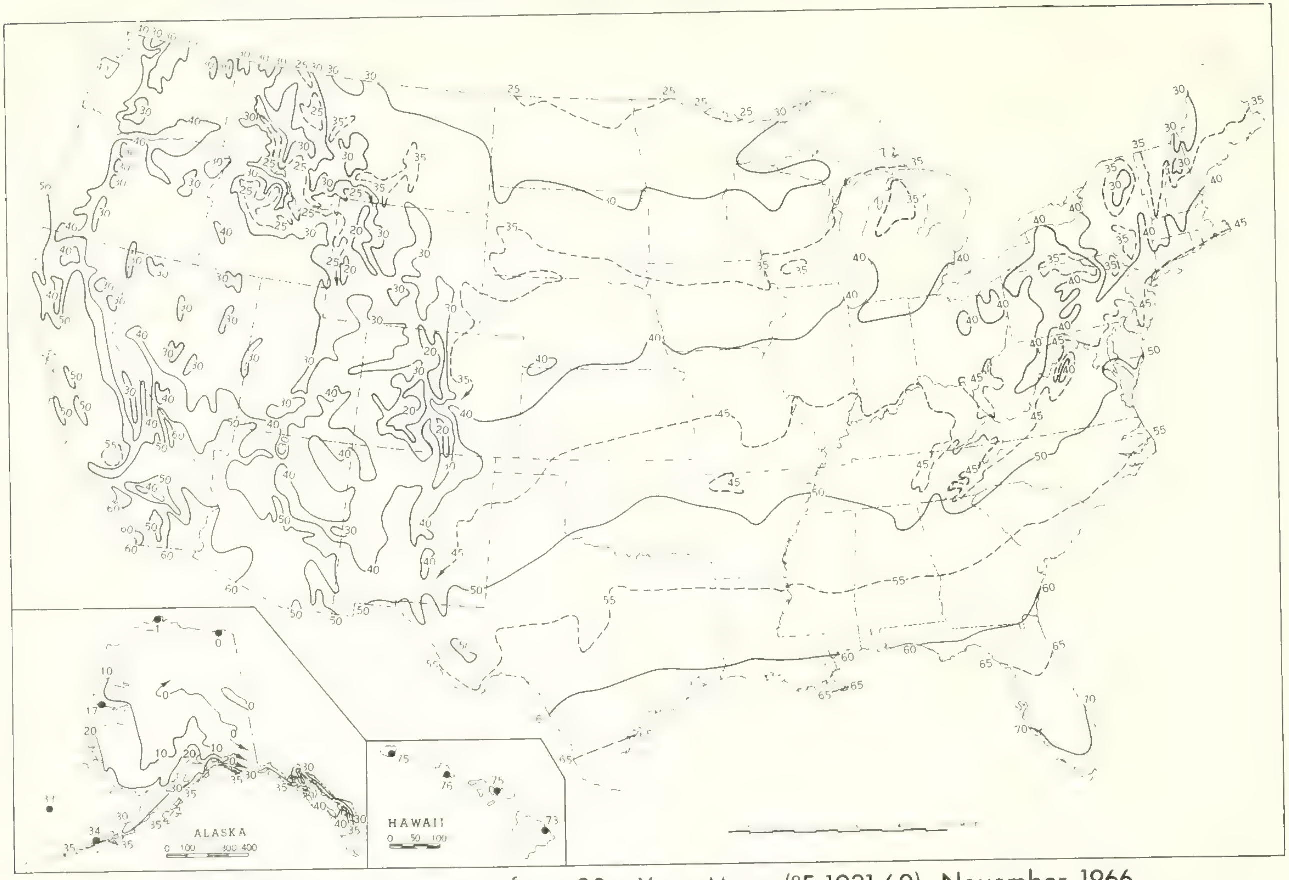
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units· Milli-atmo-cms.

Station	Day of month																														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																

The spectrophotometer measures the total amount of ozone in the atmosphere, i e , the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g , 350 milli-atmo-cm ozone implies an ozone layer 0 350 centimeter thick The code λ s designates the type of measurement made

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), November



B. Temperature Departure from 30 - Year Mean (°F 1931-60), November 1966.

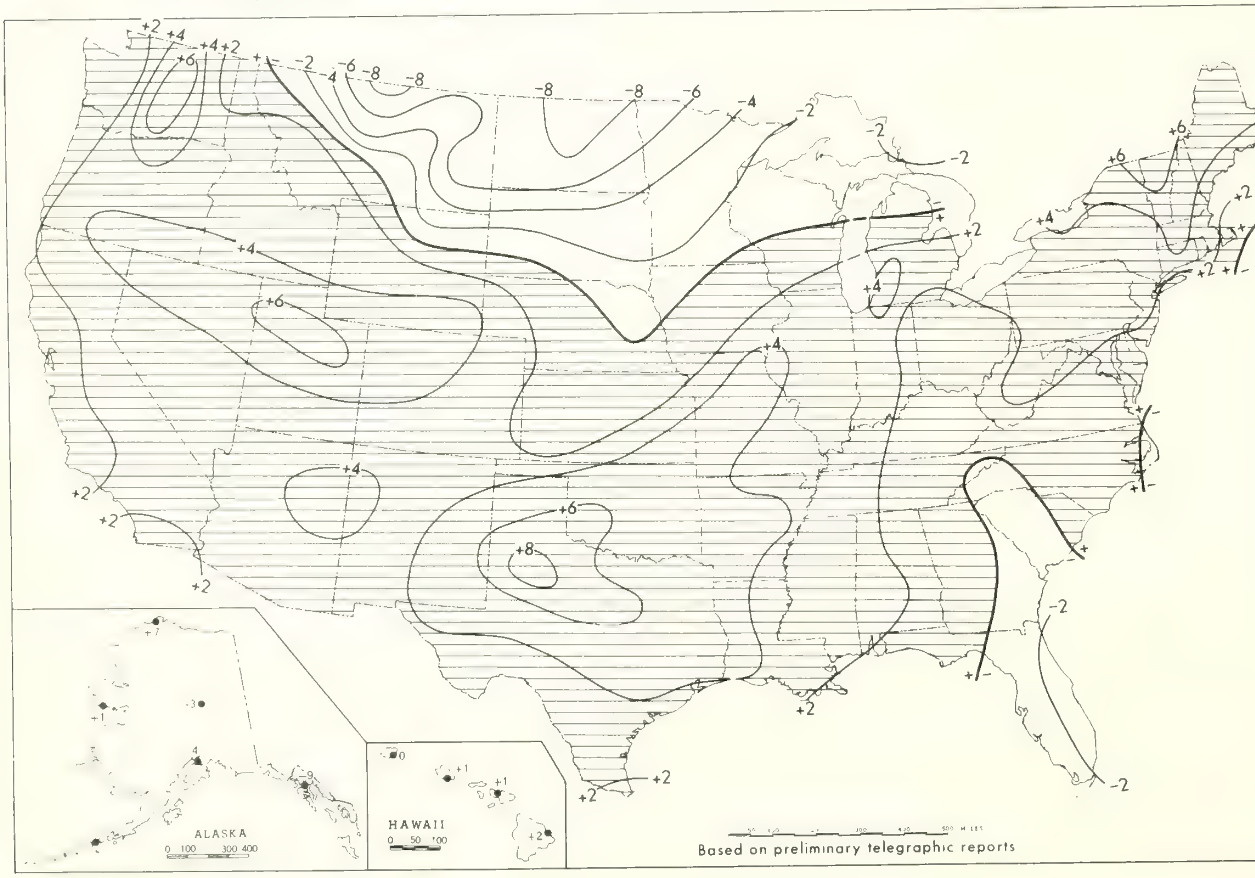


Chart II. Total Precipitation (Inches), November 1966.

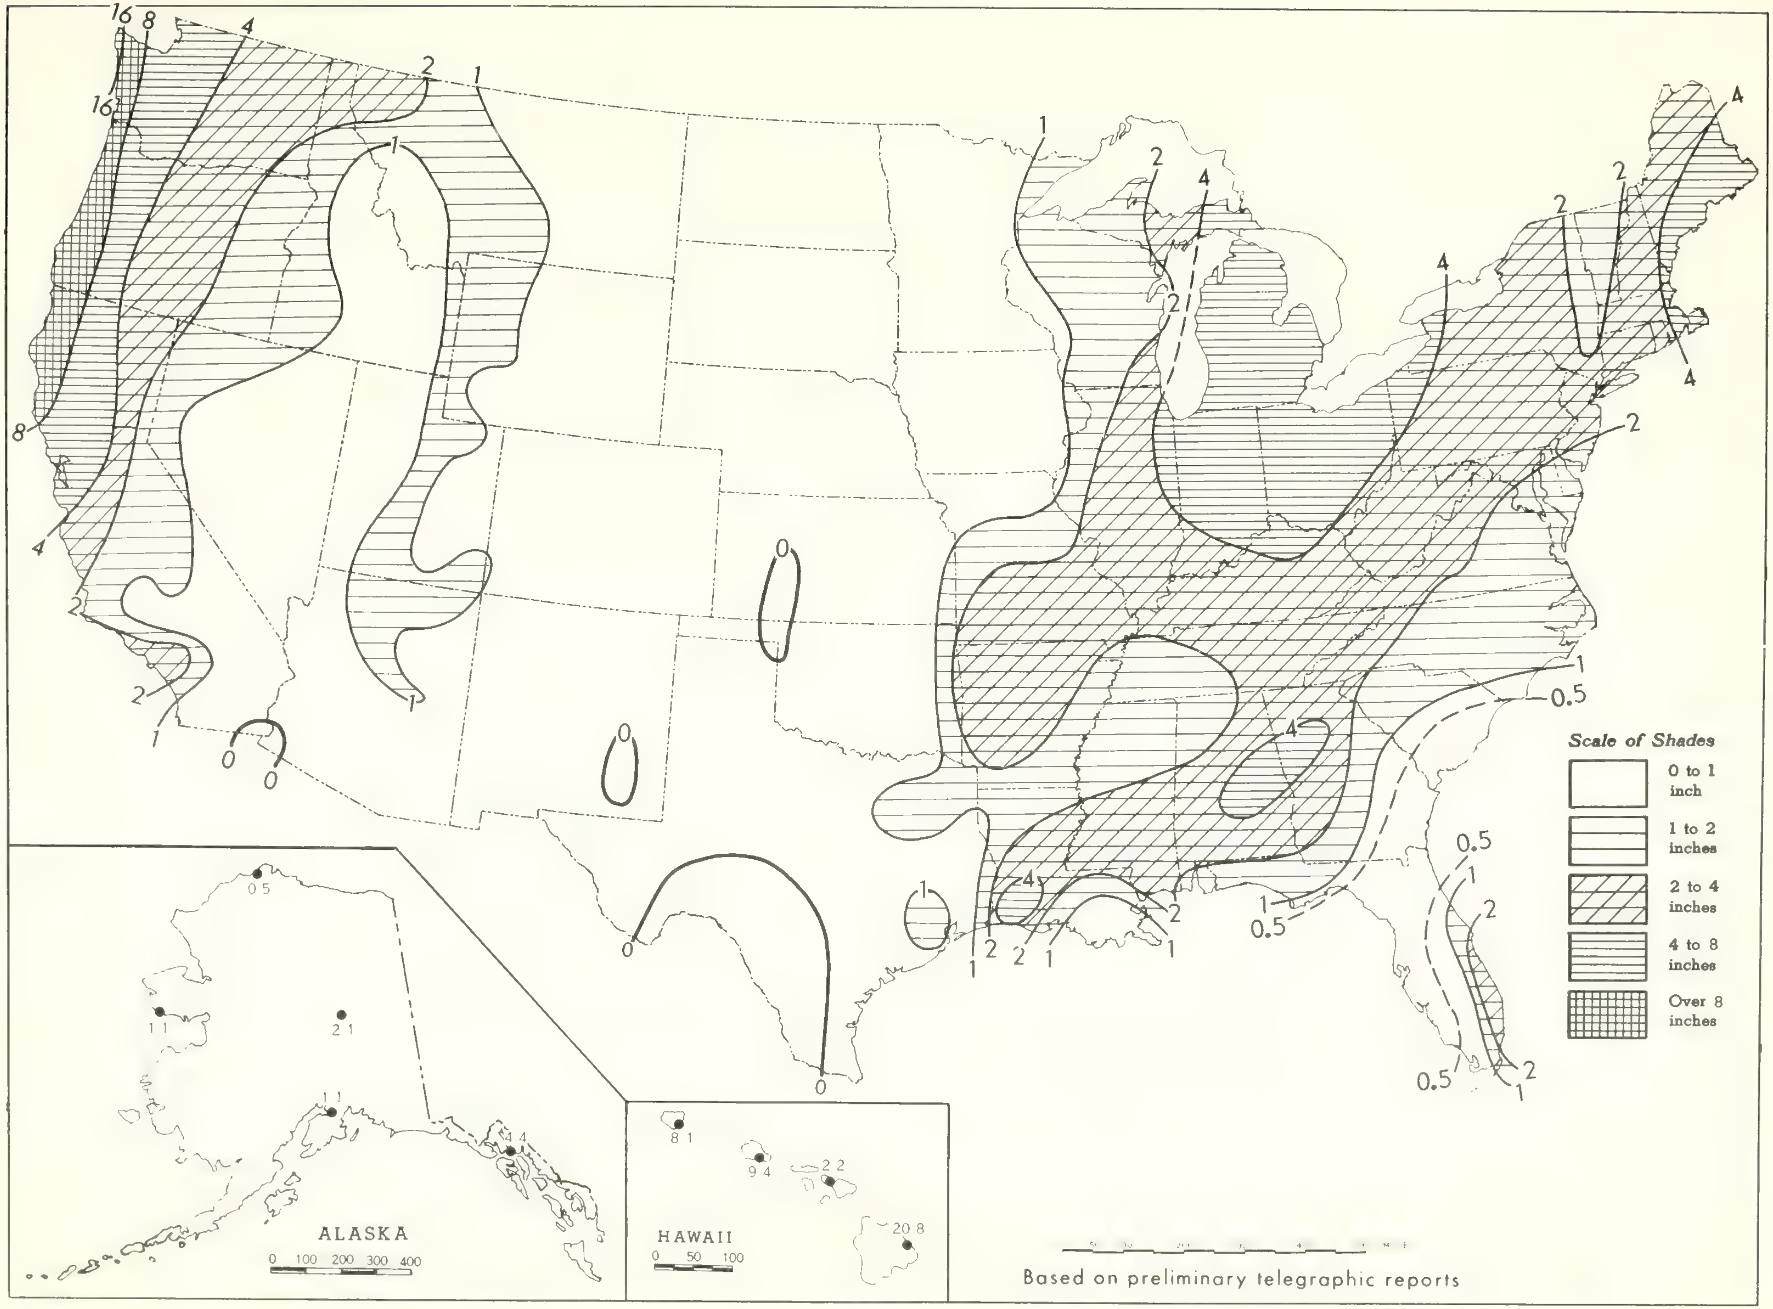
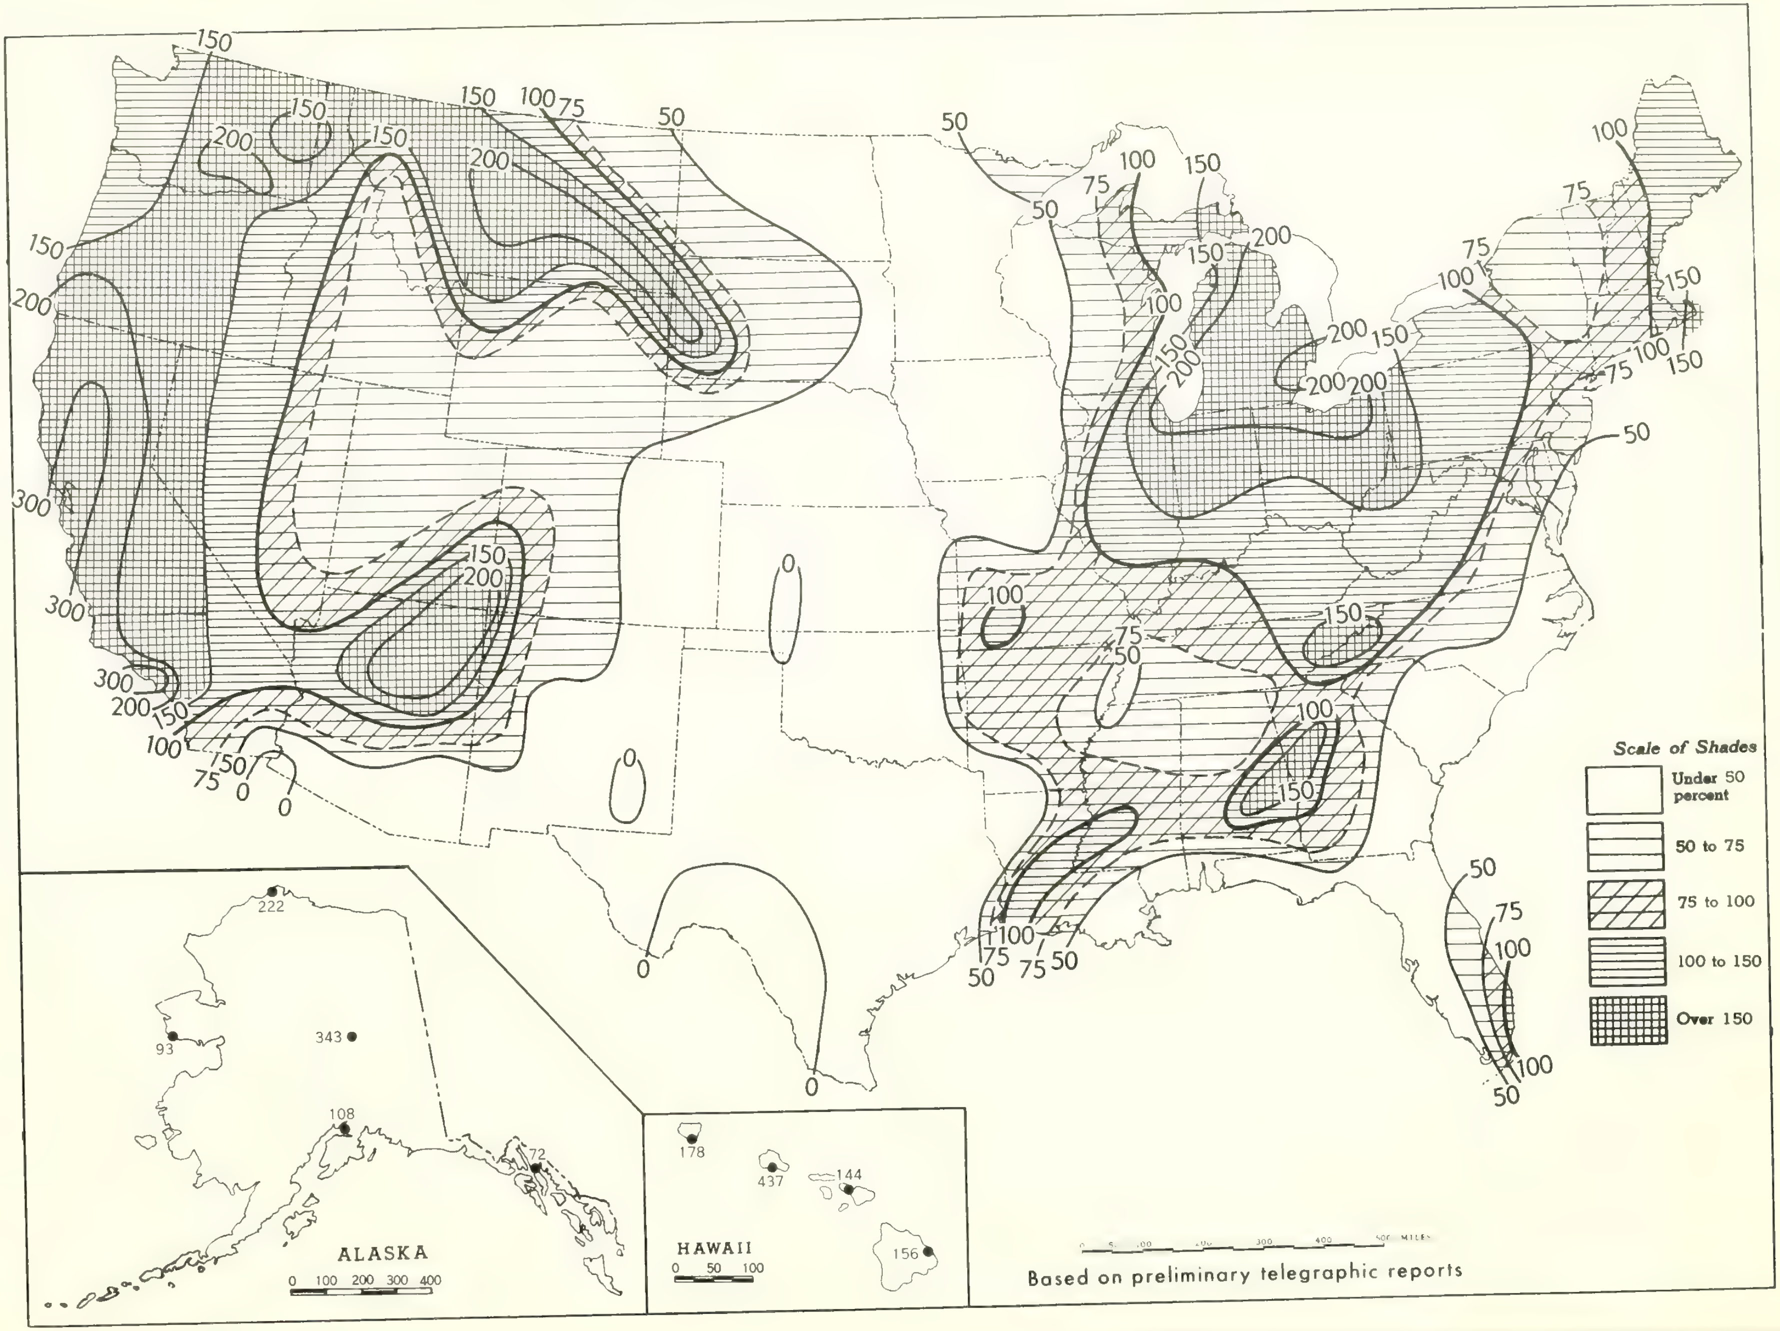


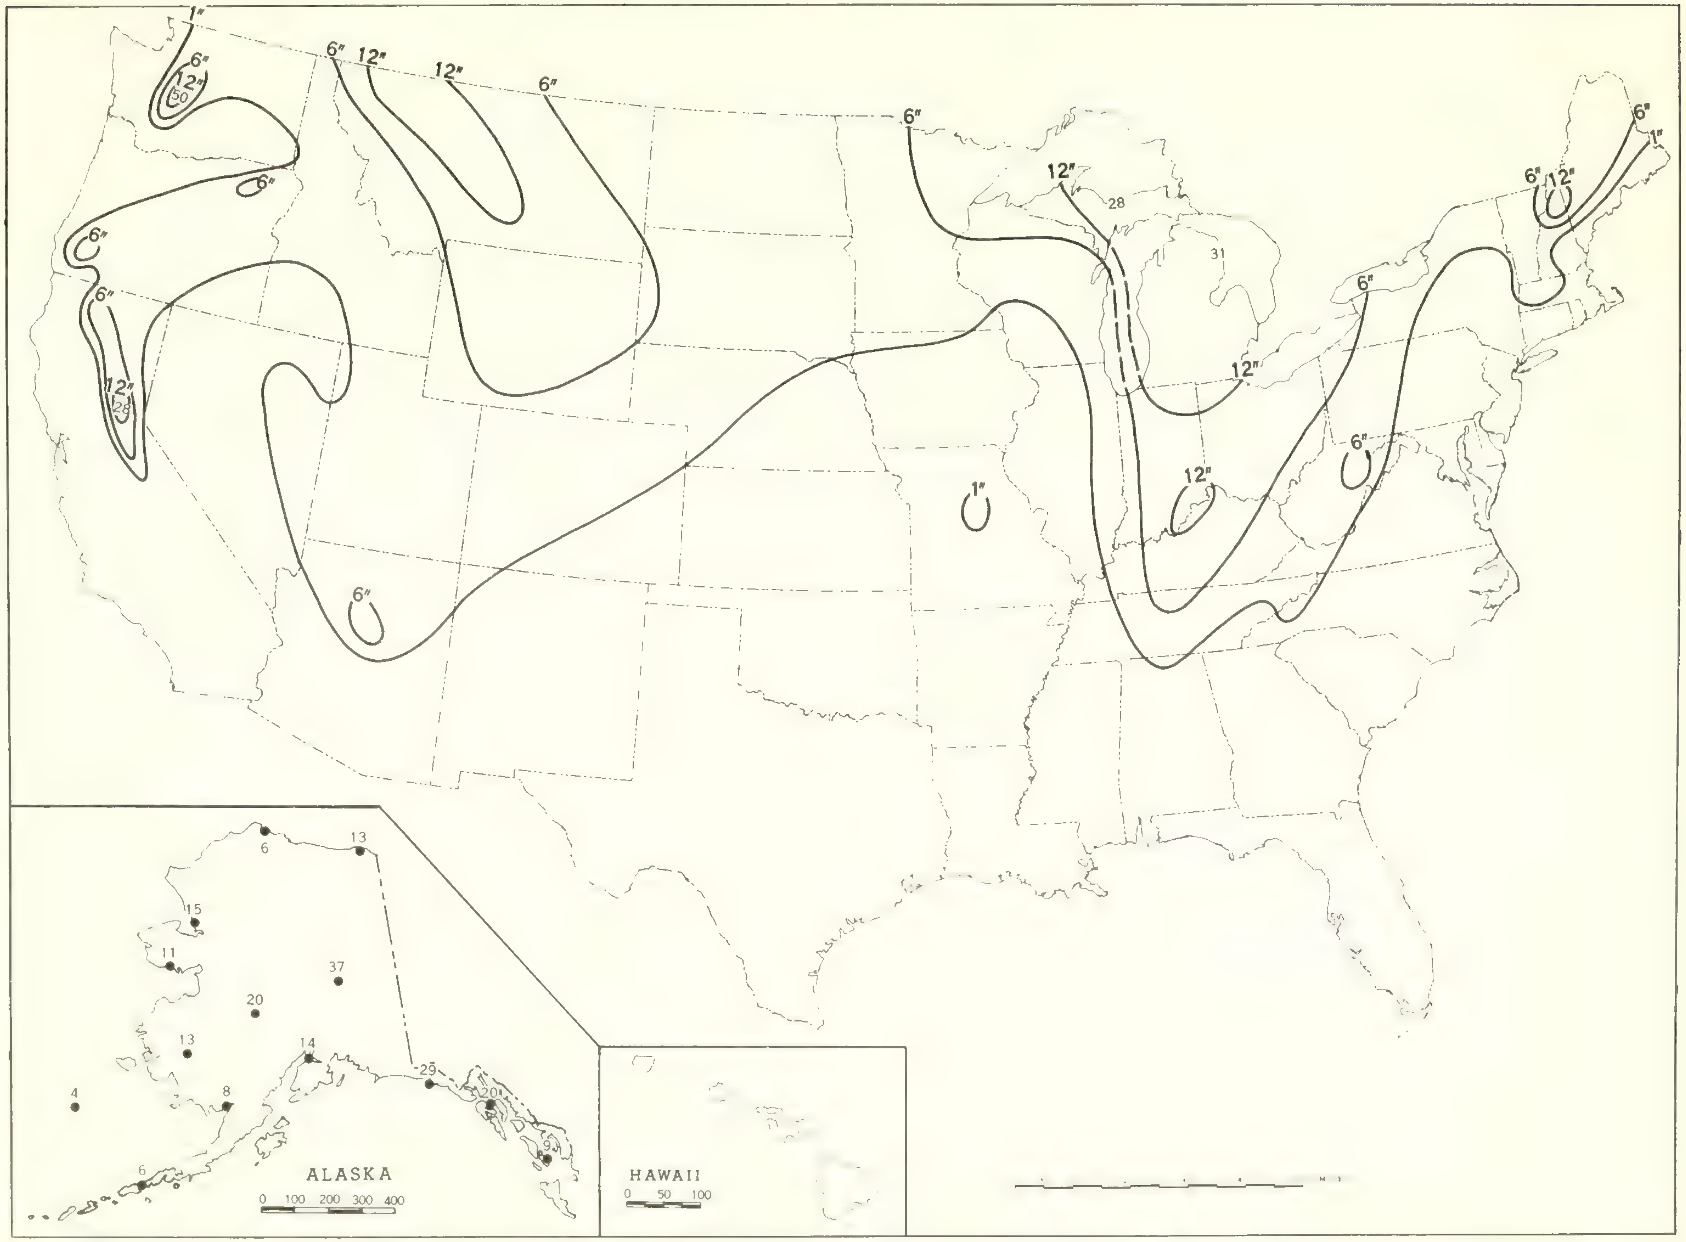
Based on preliminary telegraphic reports

Chart III. Percentage of Normal Precipitation, November 1966.



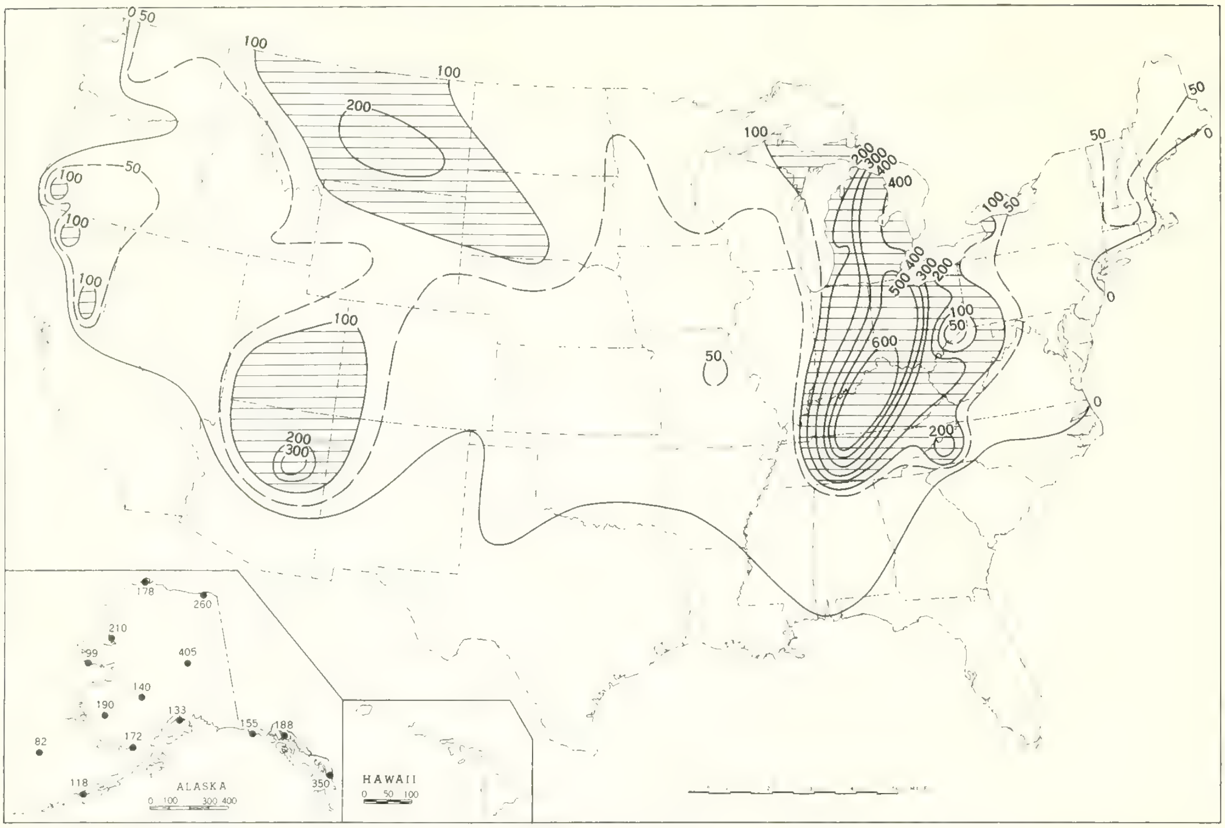
Based on preliminary telegraphic reports

Chart IV. Total Snowfall (Inches), November 1966.

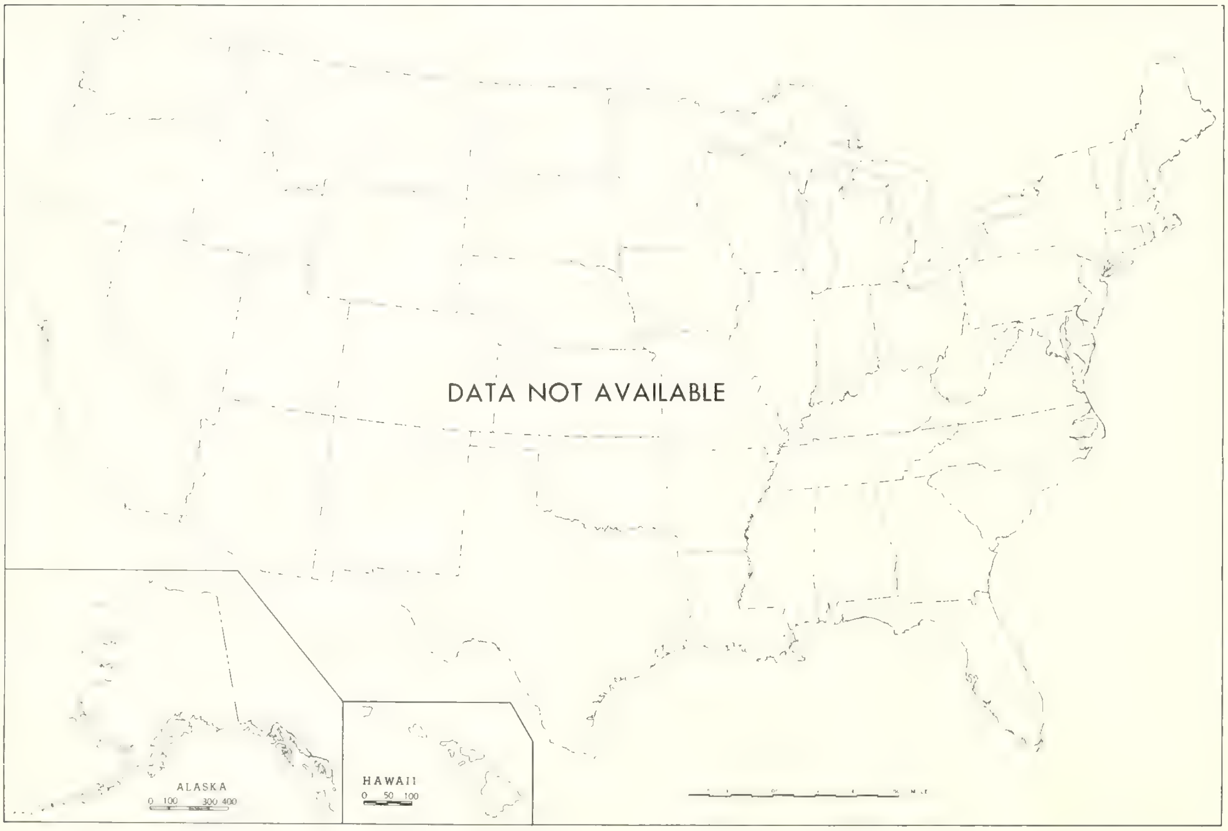


This is the total of unmelted snowfall recorded during the month at Weather Bureau and cooperative stations. This chart and Chart V are published only for the months of November through April although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, November 1966.

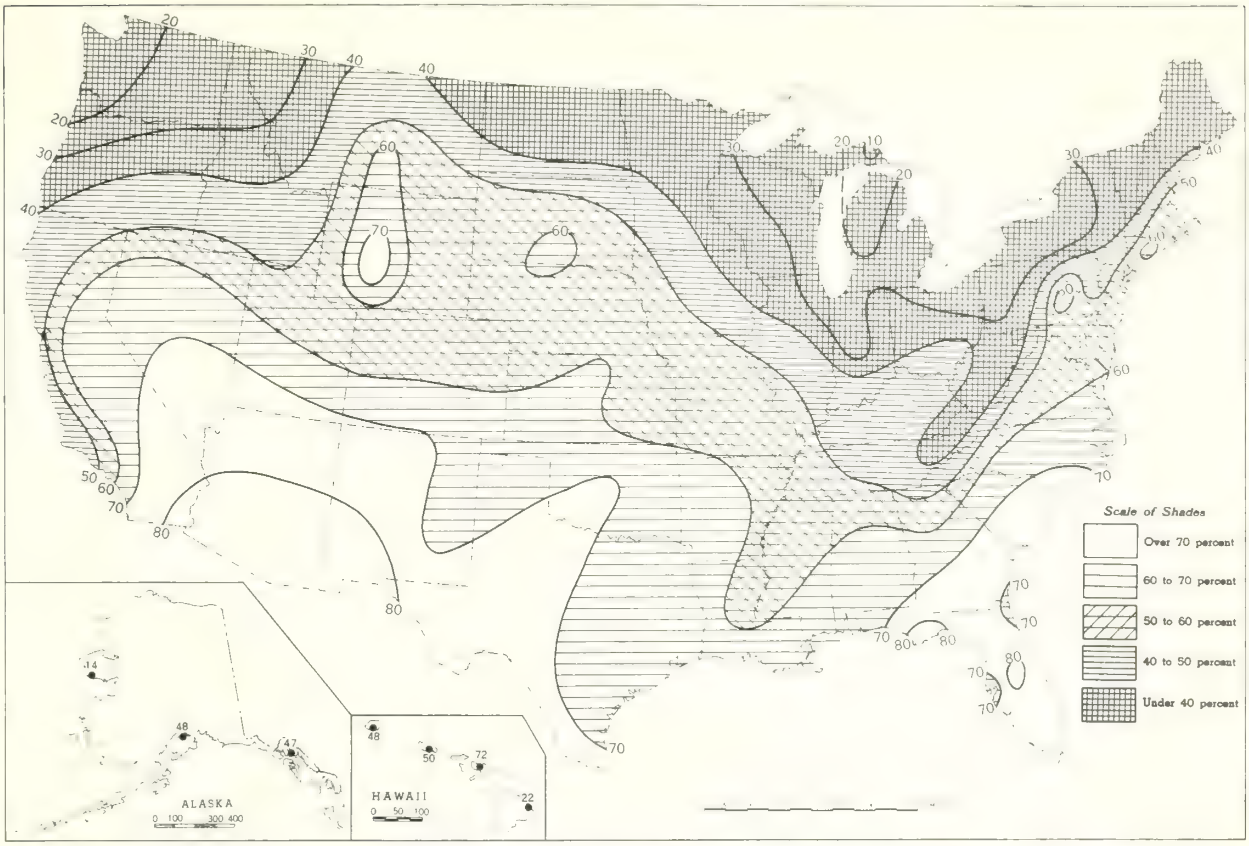


B. Depth of Snow on Ground (Inches), 7:00 a. m. E. S. T., November 1966.

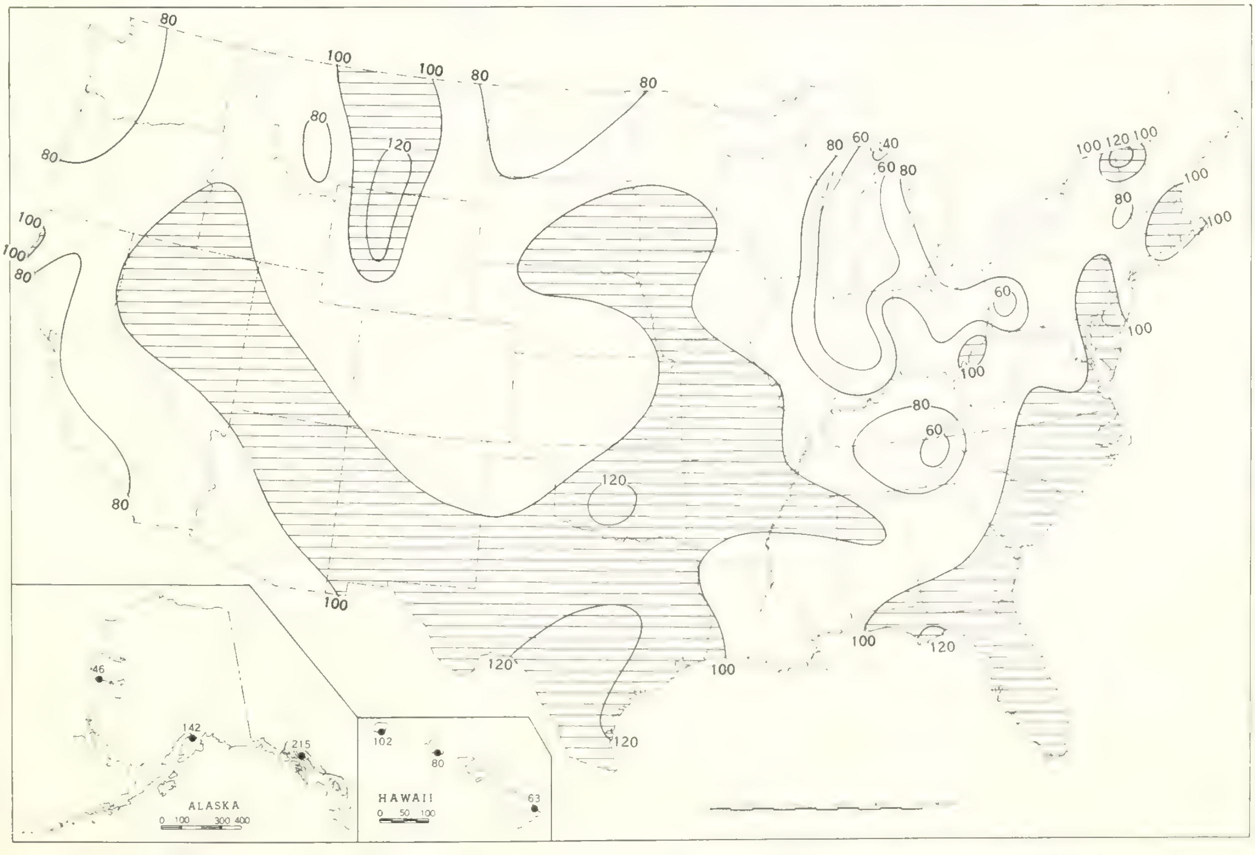


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a. m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, November 1966.

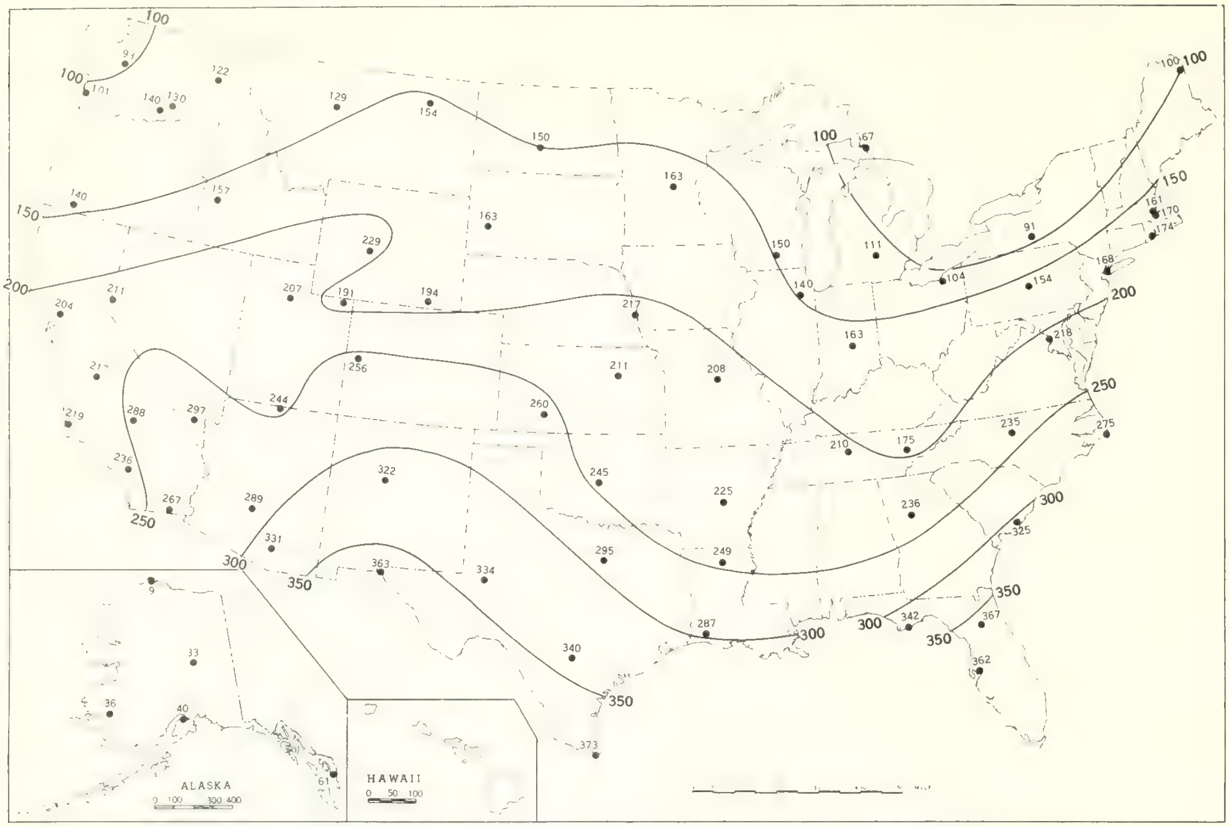


B. Percentage of Mean Monthly Sunshine, November 1966.

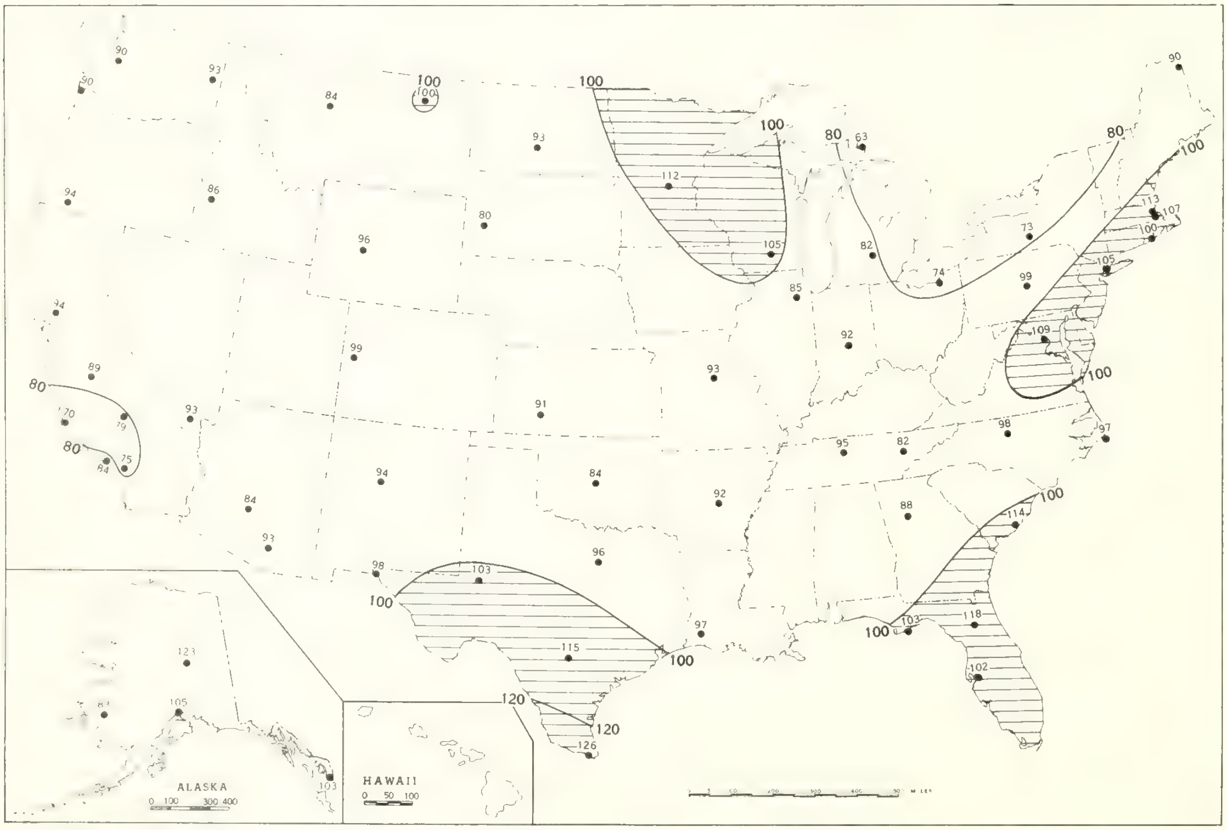


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, November 1966.

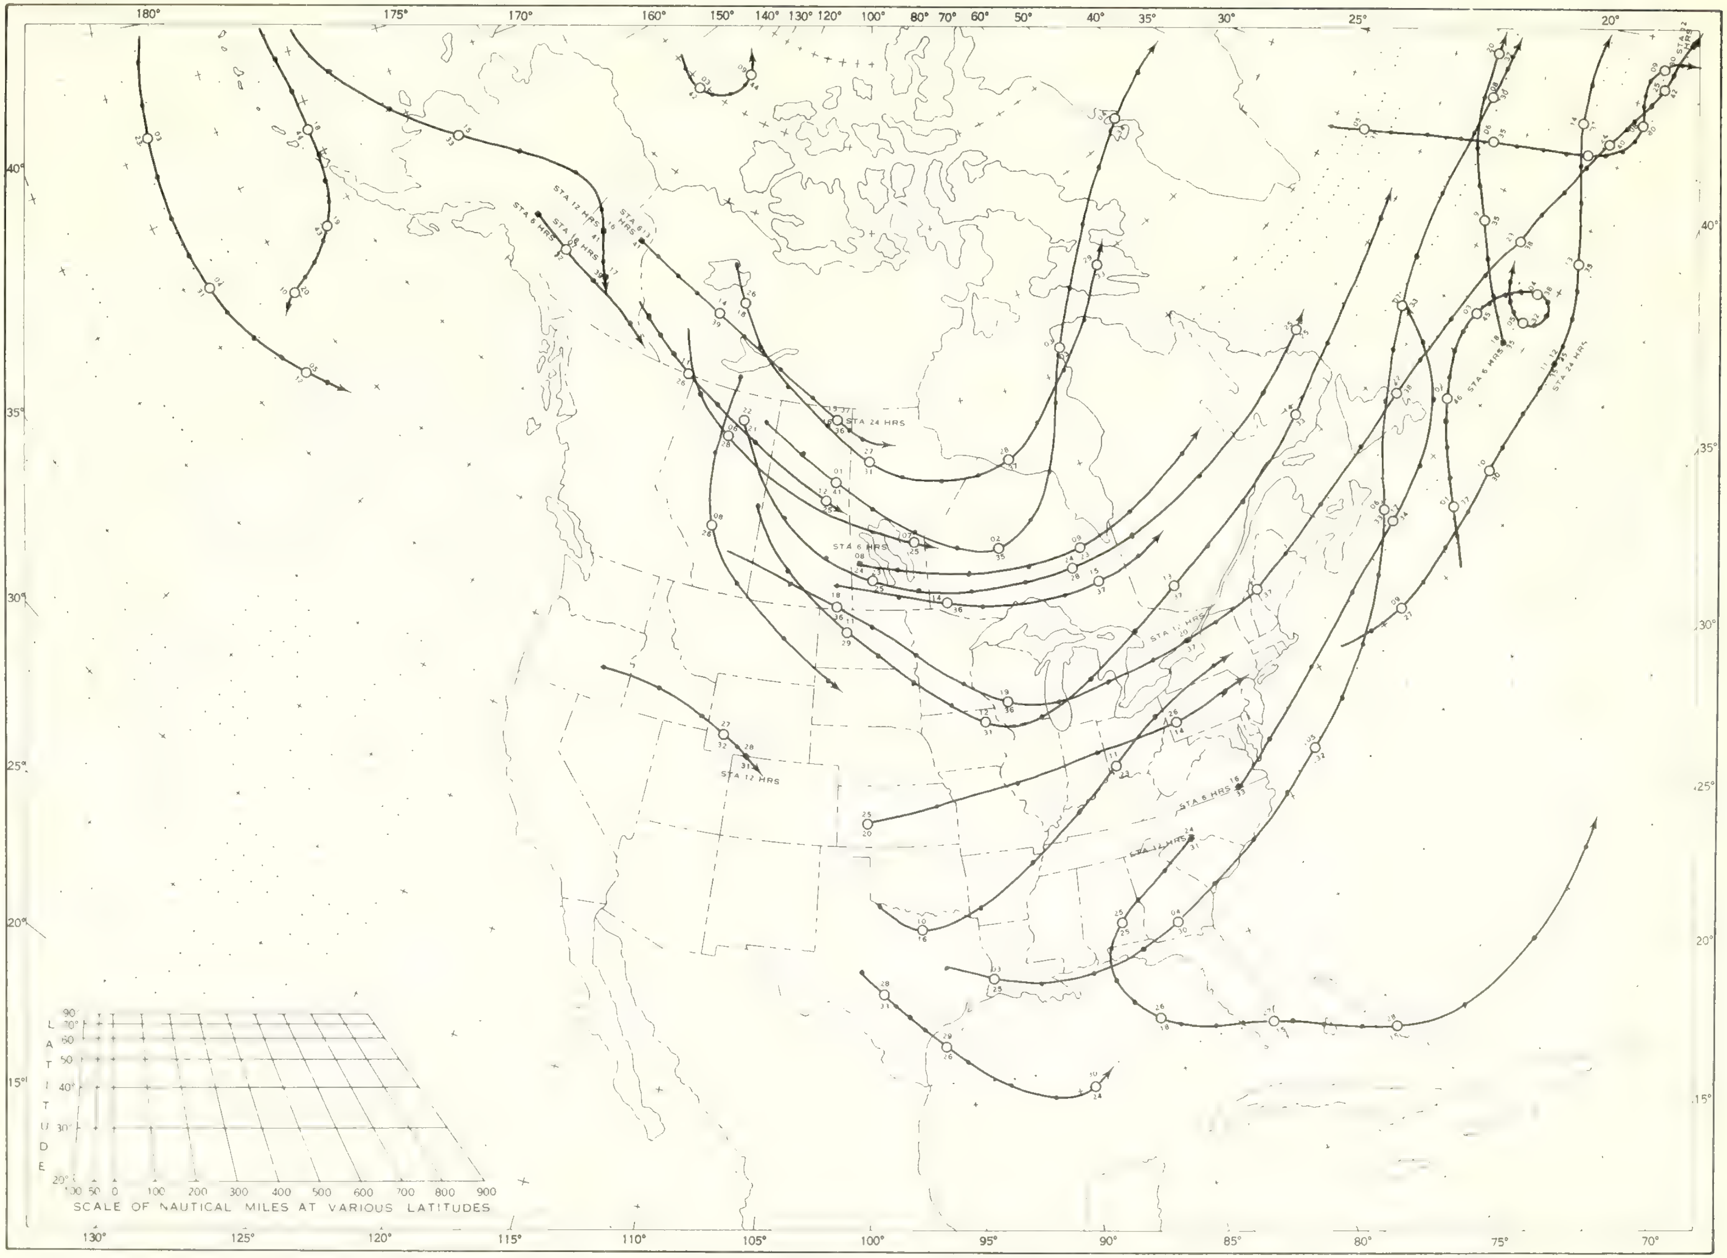


B. Percentage of Mean Daily Solar Radiation, November 1966.



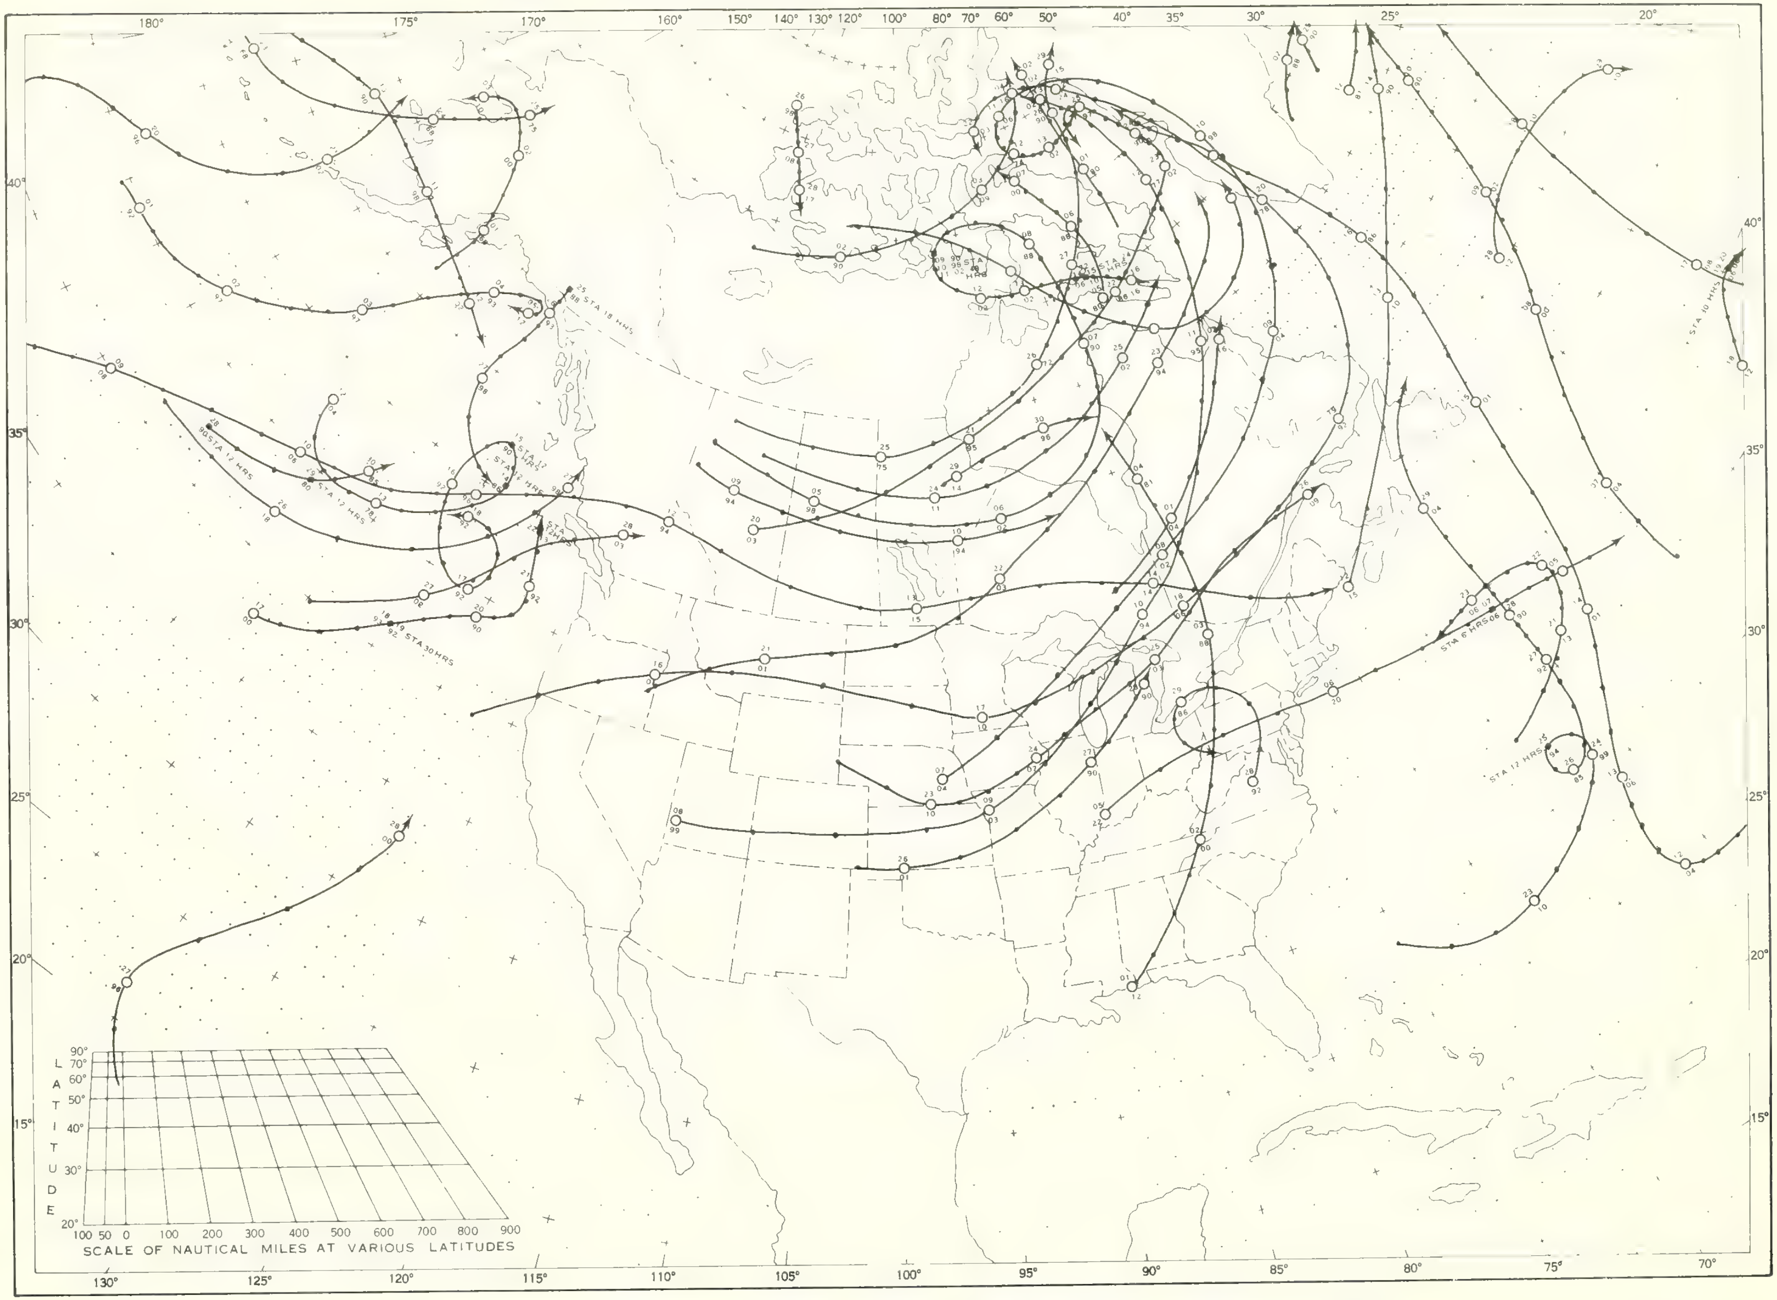
Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, November 1966.



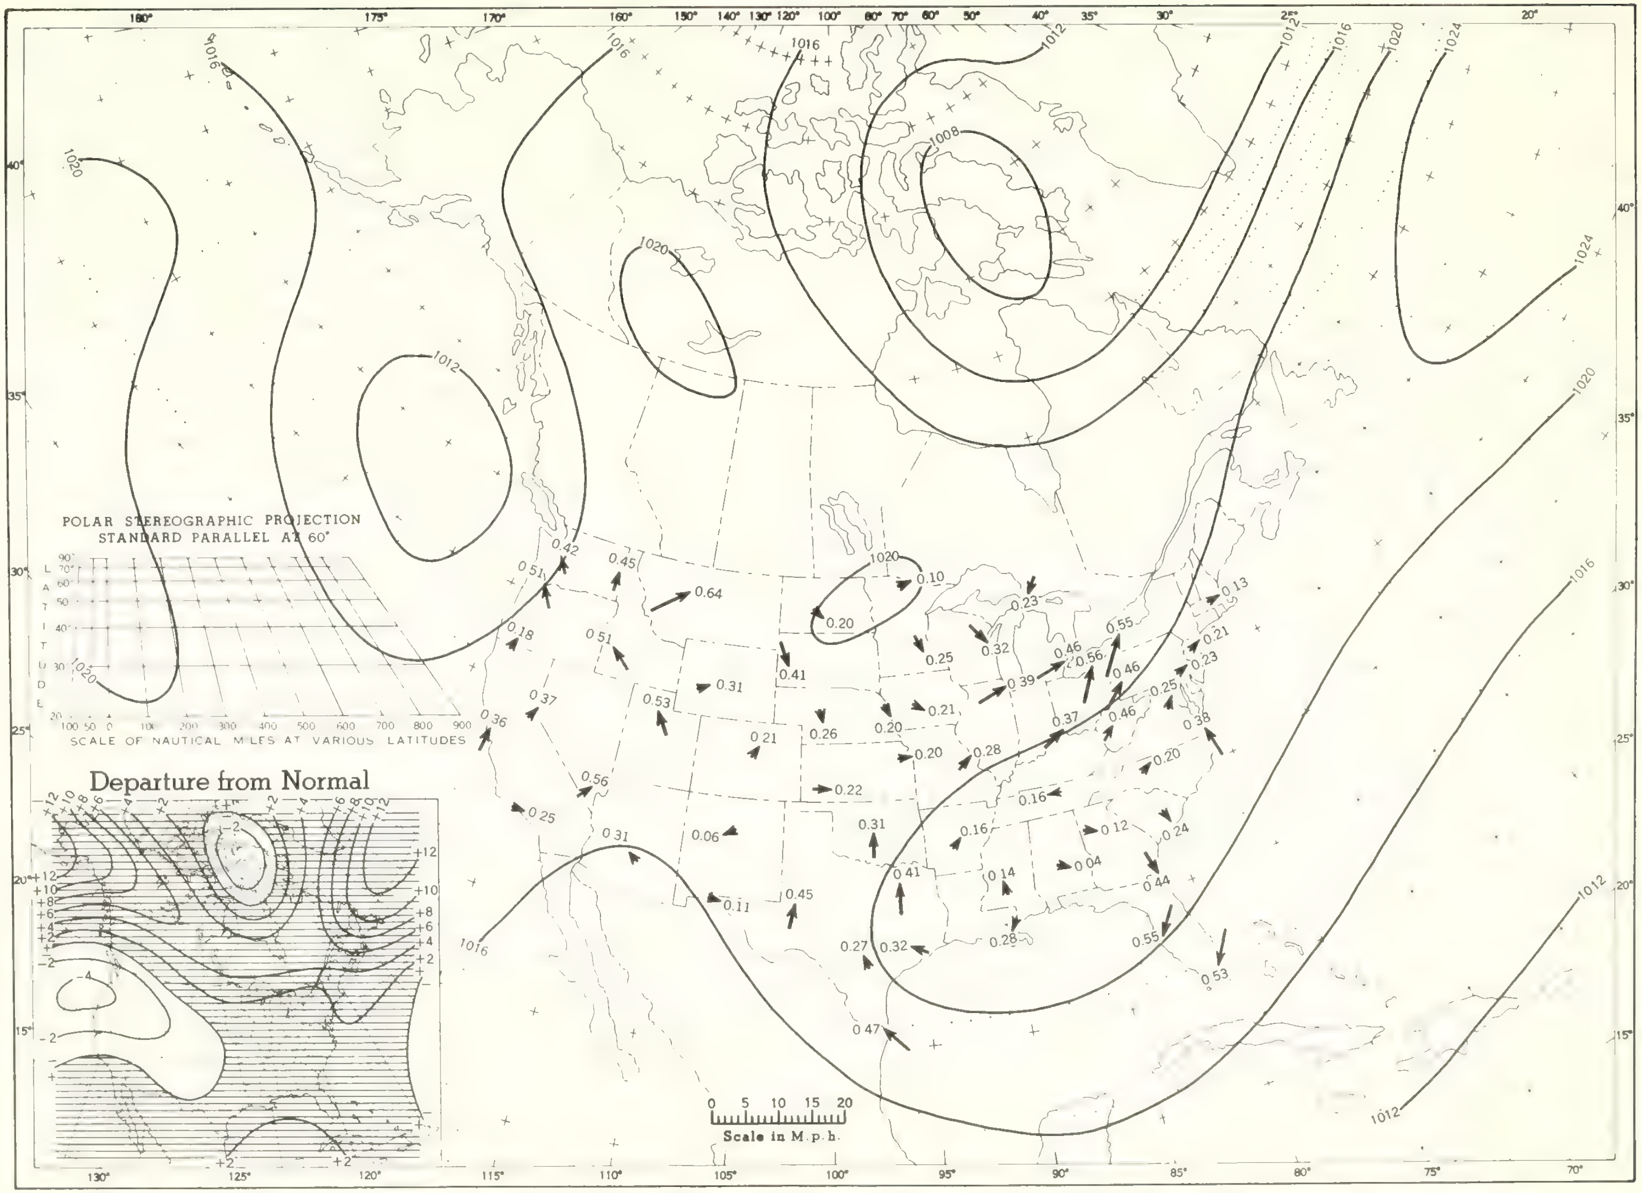
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, November 1966.



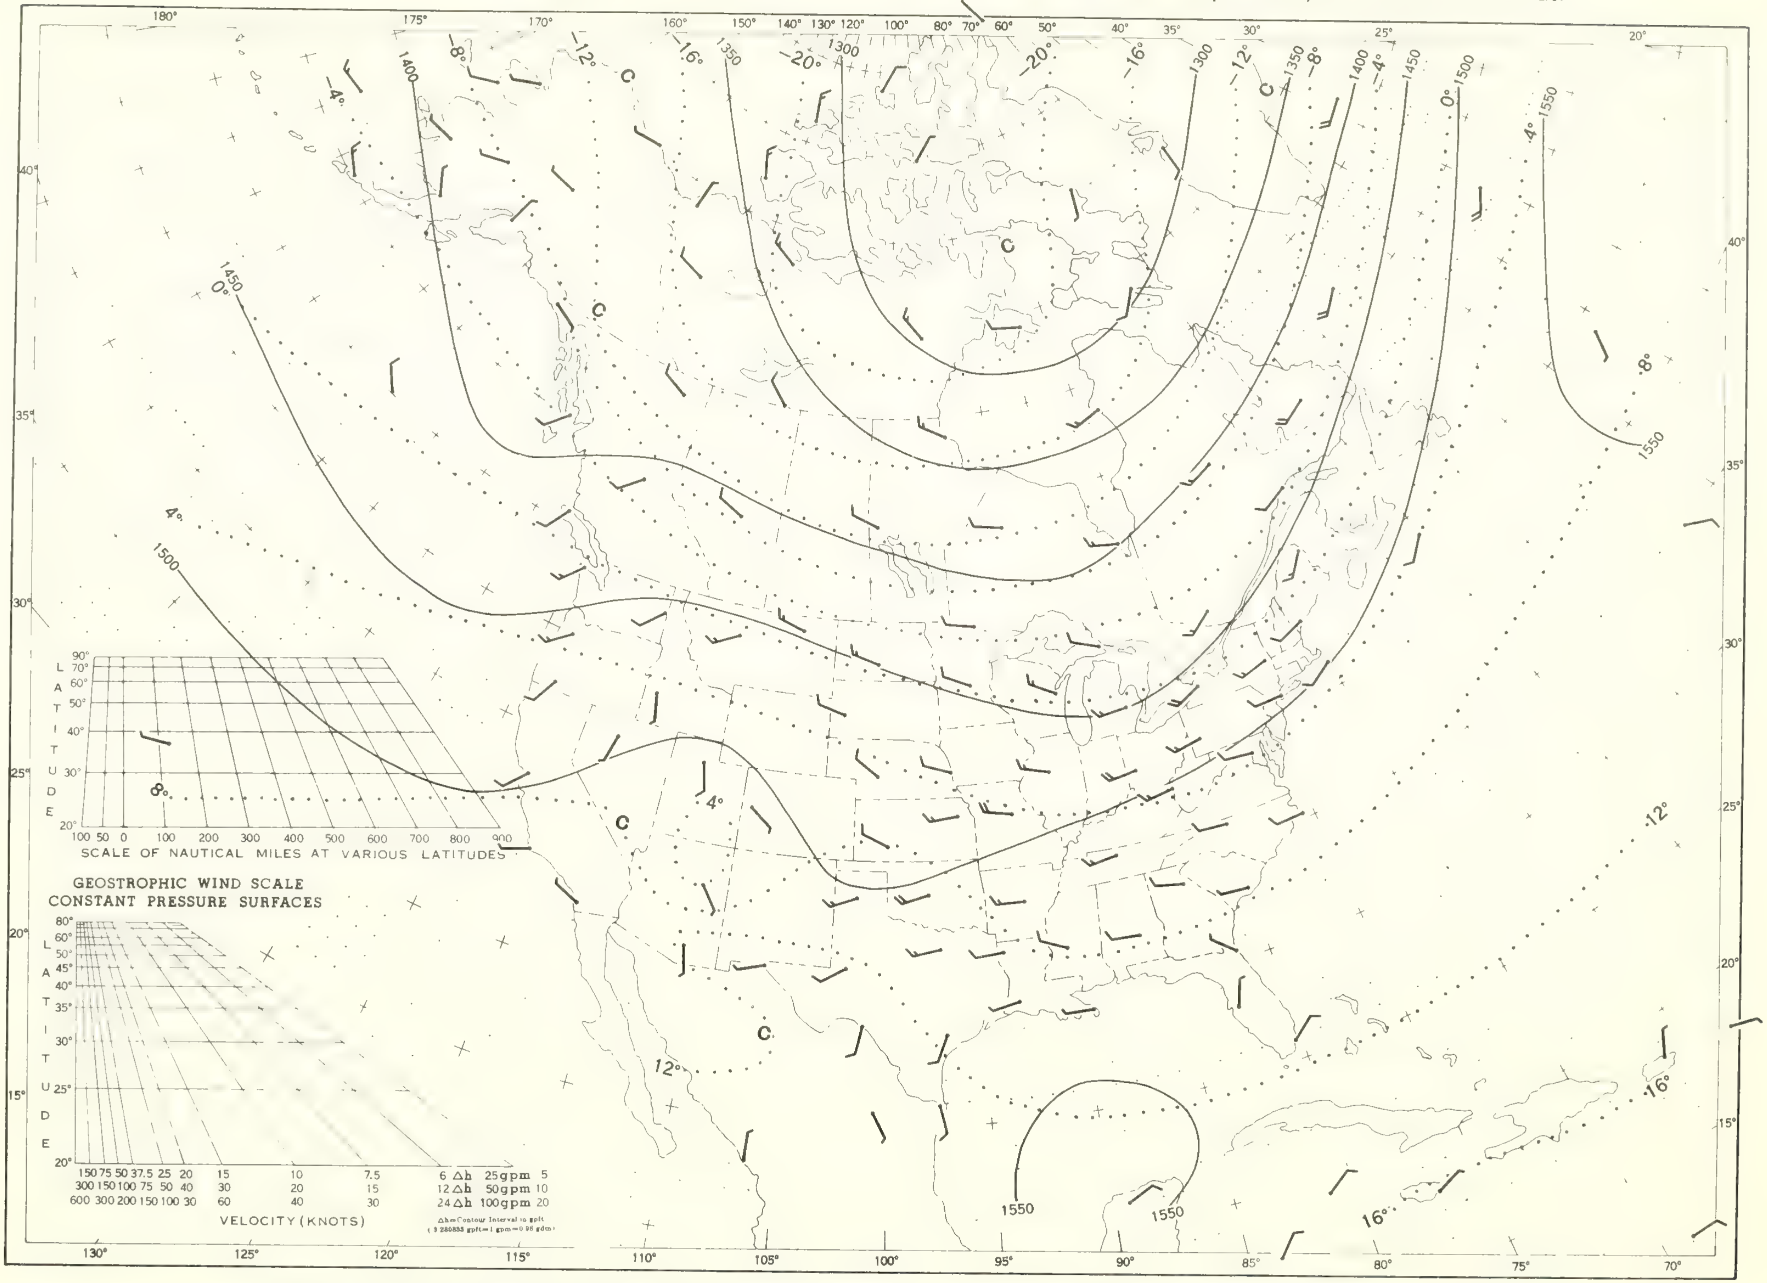
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, November 1966. Inset: Departure of Average Pressure (mb) from Normal, November 1966.



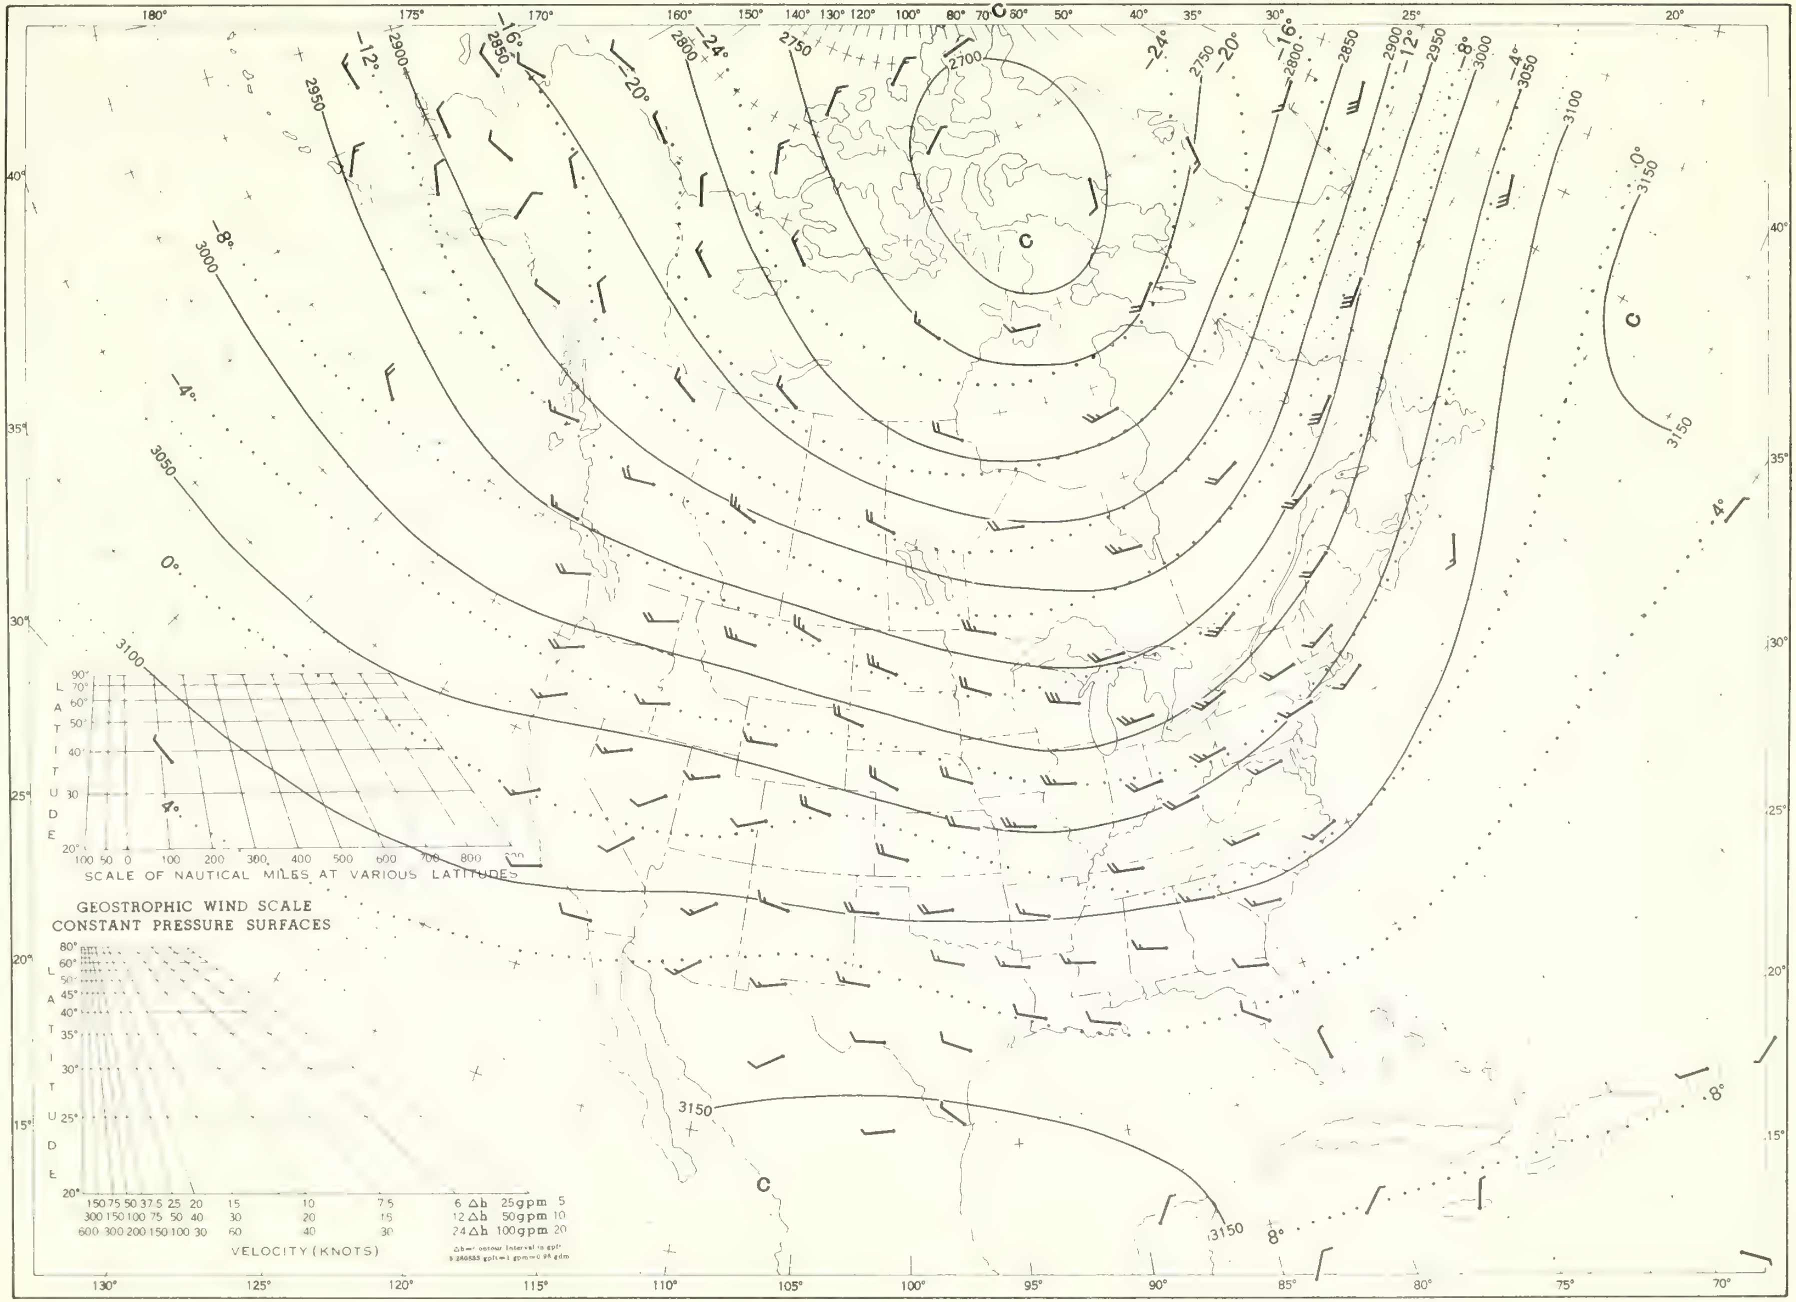
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, November 1966. Average Height and Temperature, and Resultant Winds.



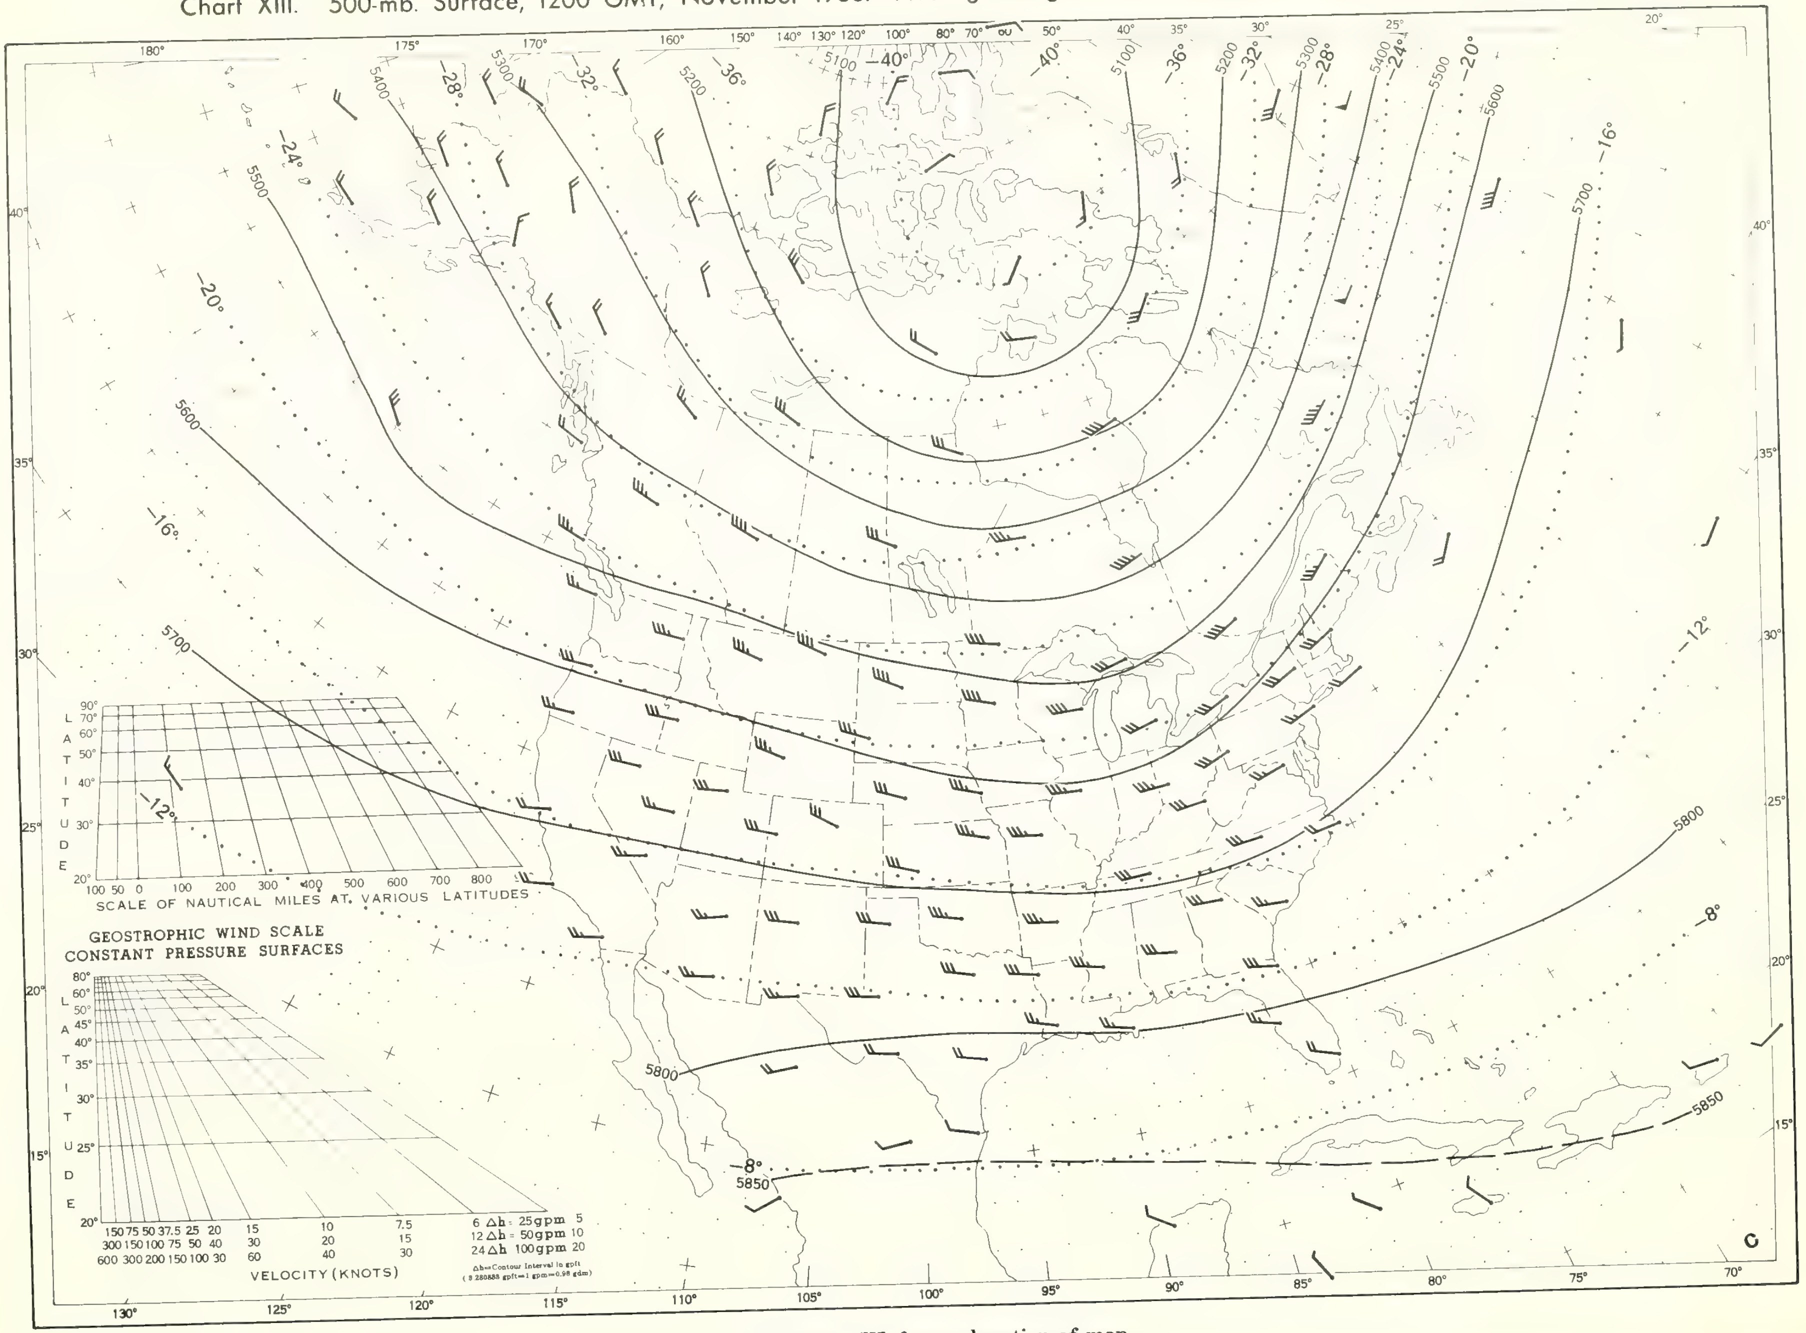
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, November 1966. Average Height and Temperature, and Resultant Winds.



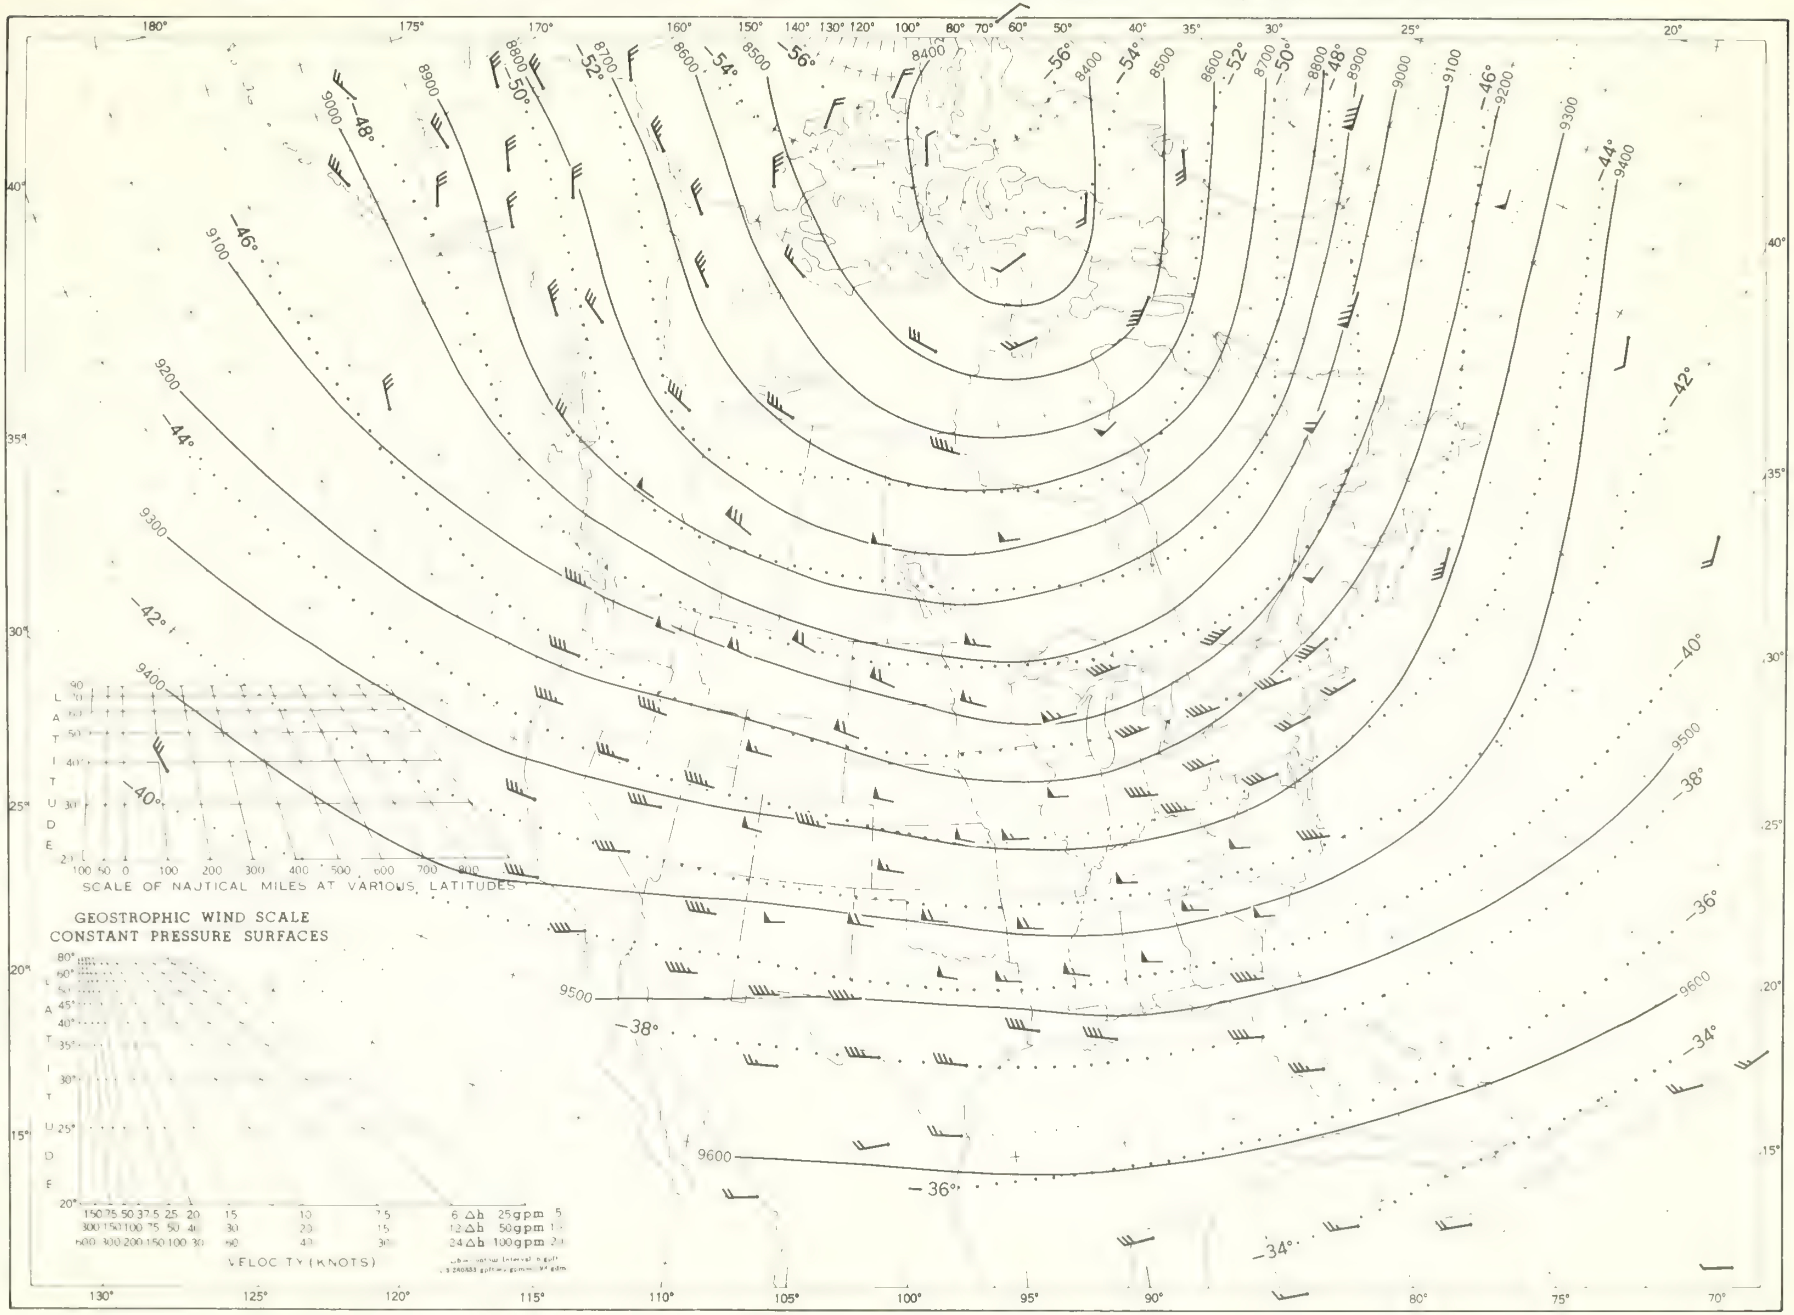
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, November 1966. Average Height and Temperature, and Resultant Winds.



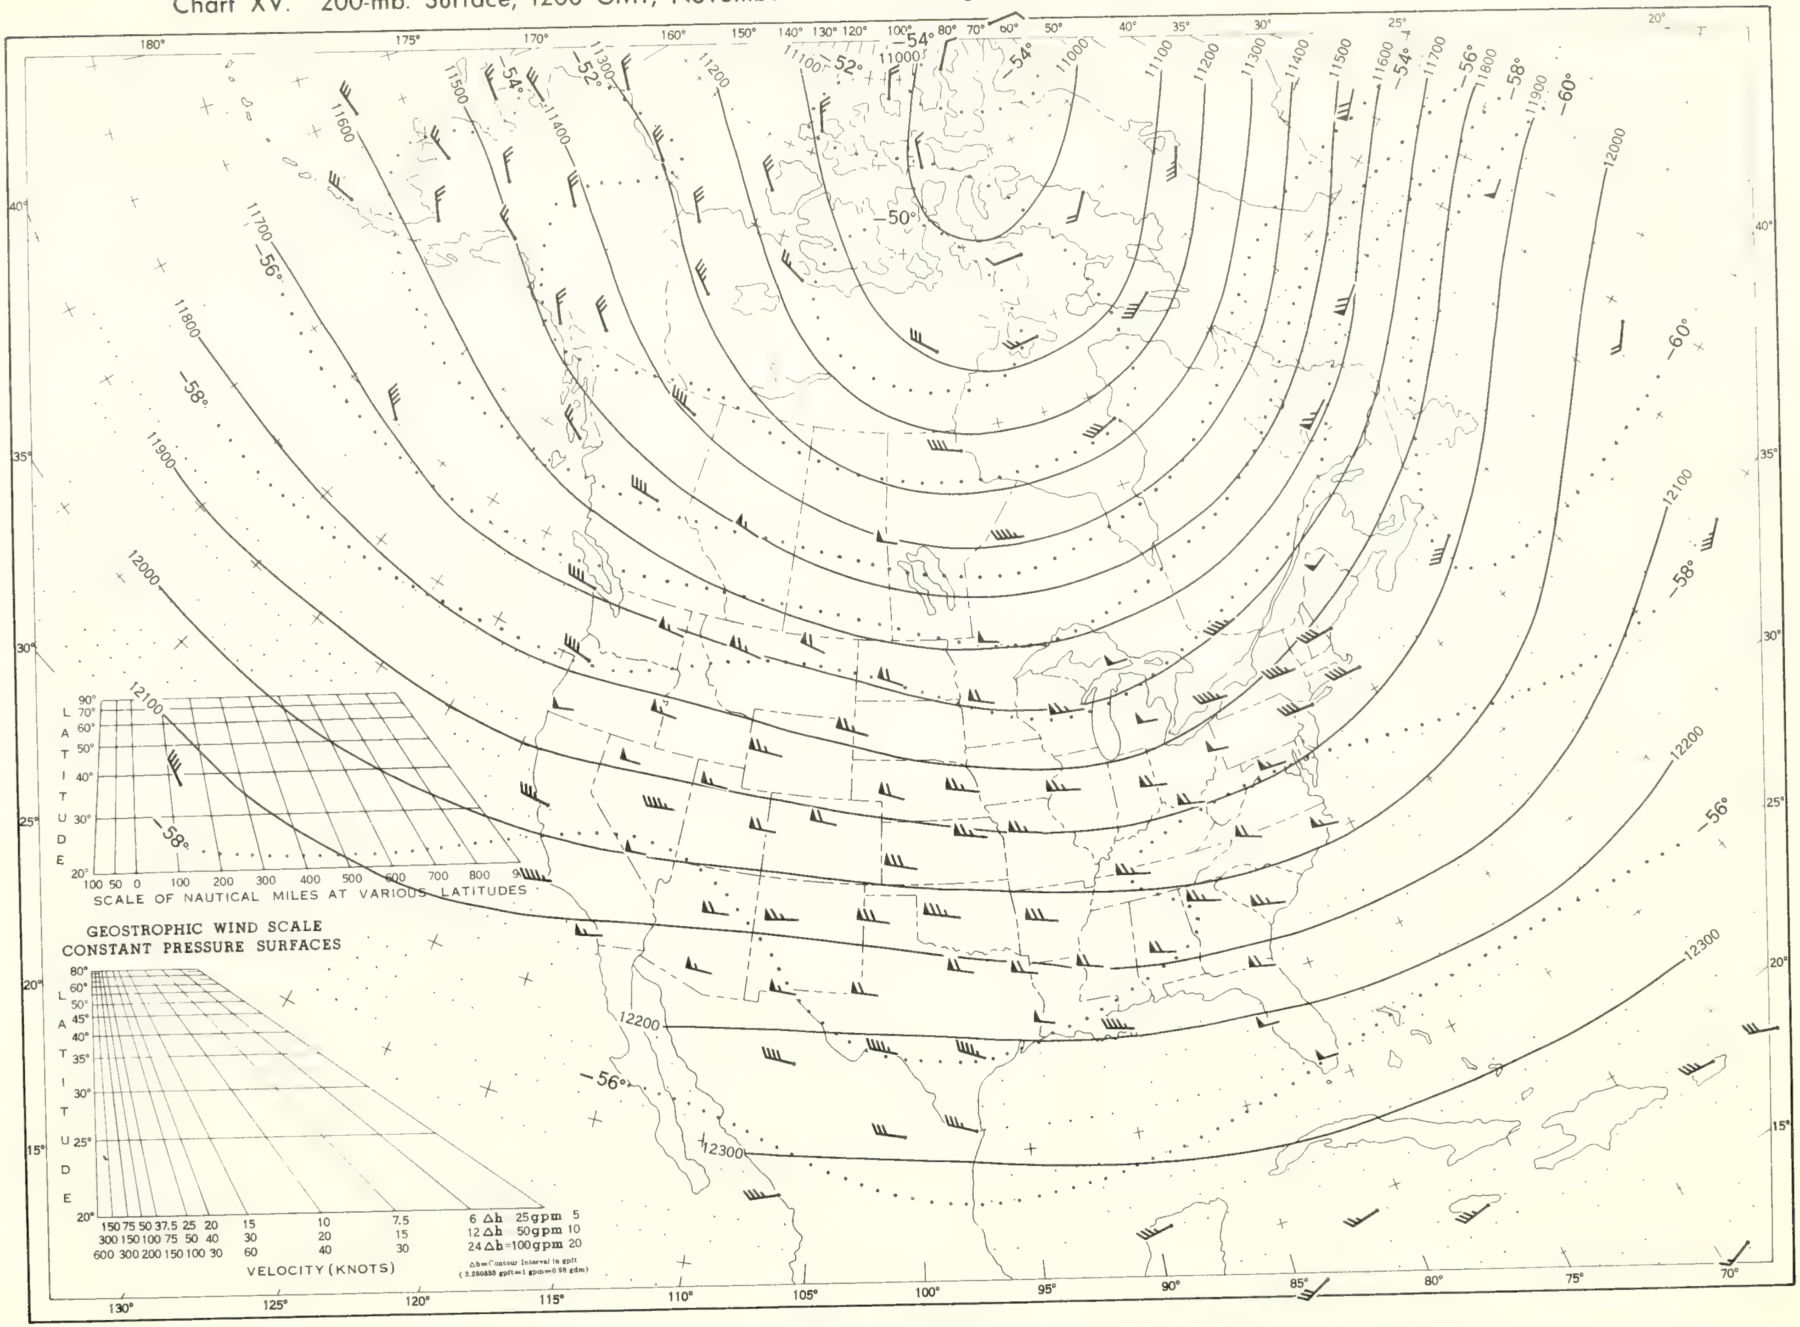
See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, November 1966. Average Height and Temperature, and Resultant Winds.



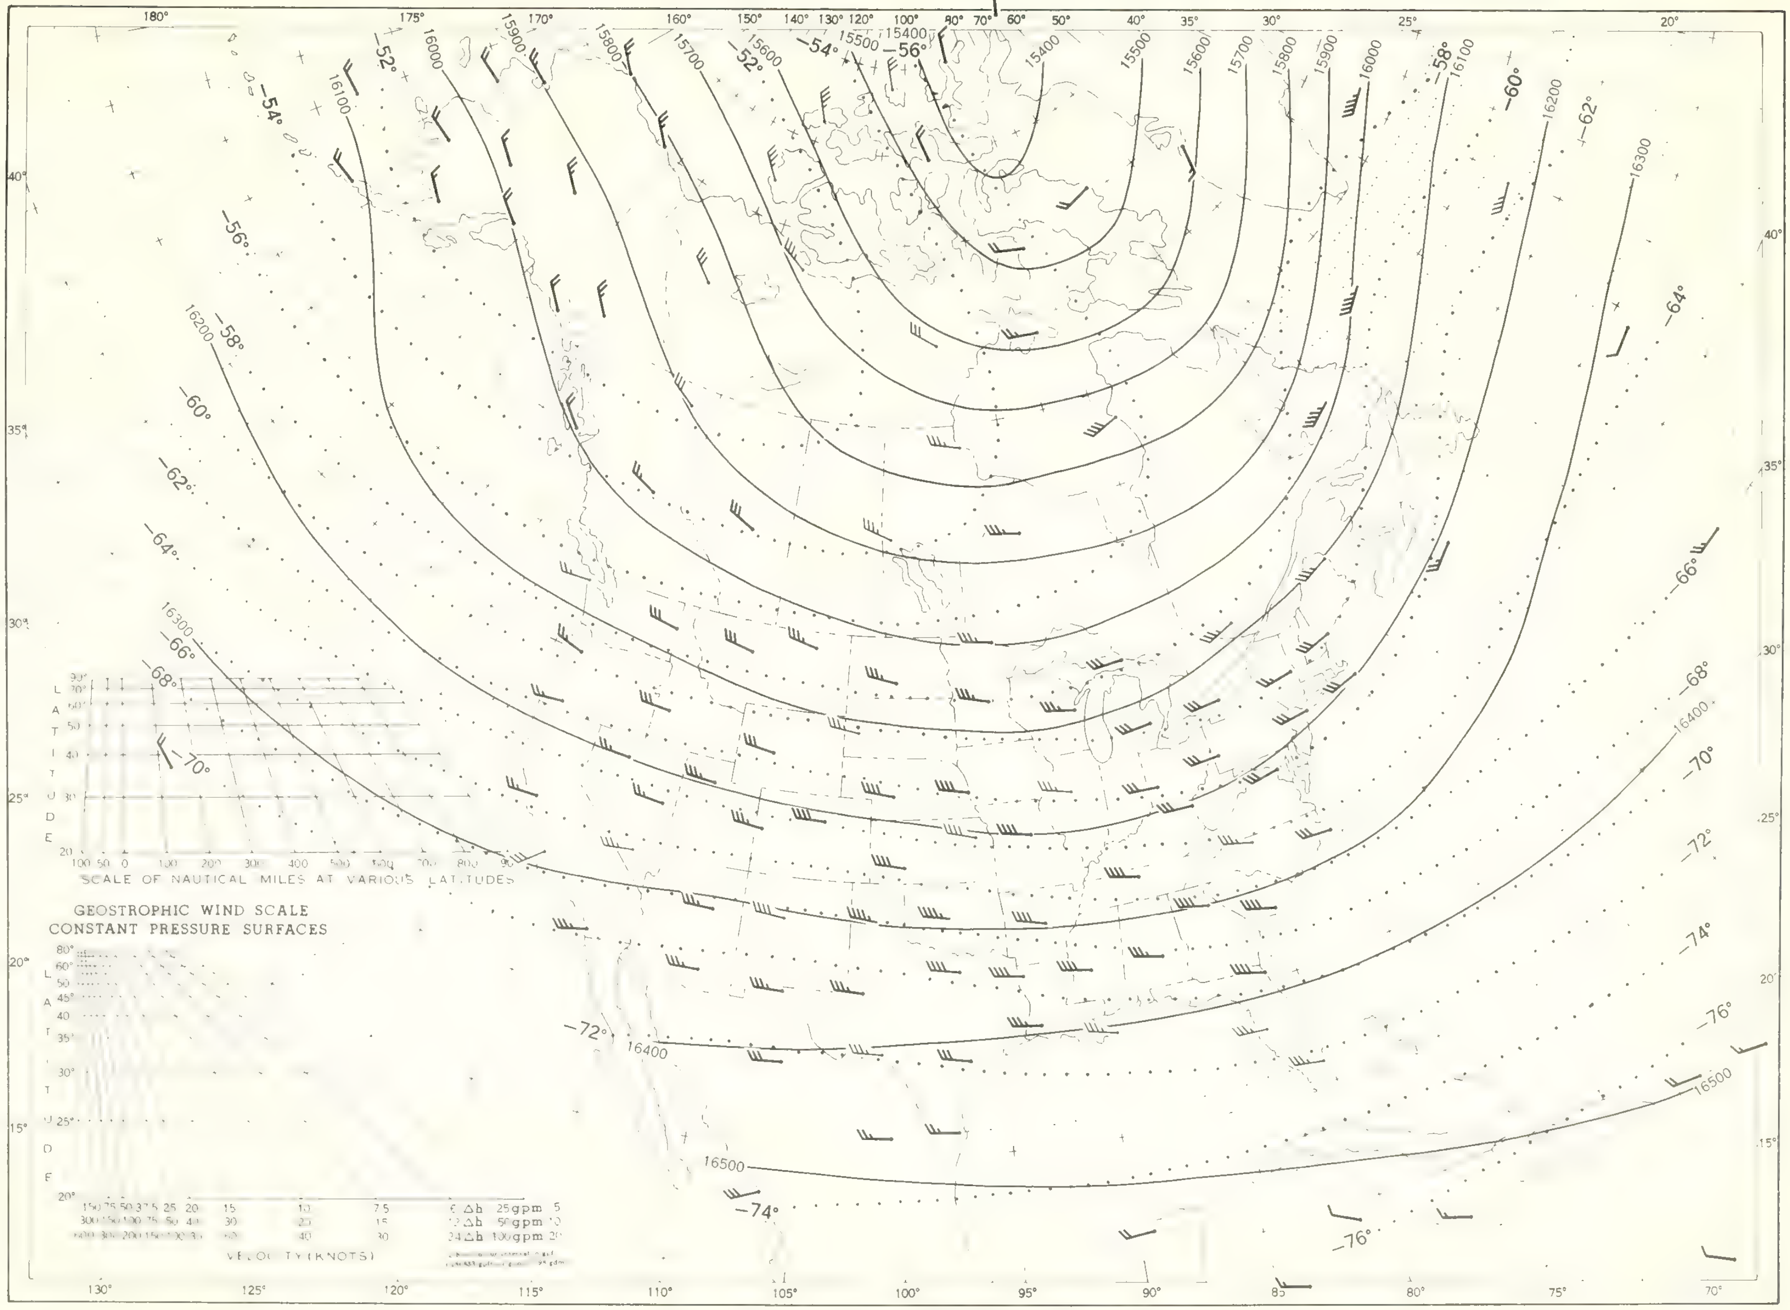
See Chart XI for explanation of map.

Chart XV. 200-mb. Surface, 1200 GMT, November 1966. Average Height and Temperature, and Resultant Winds.



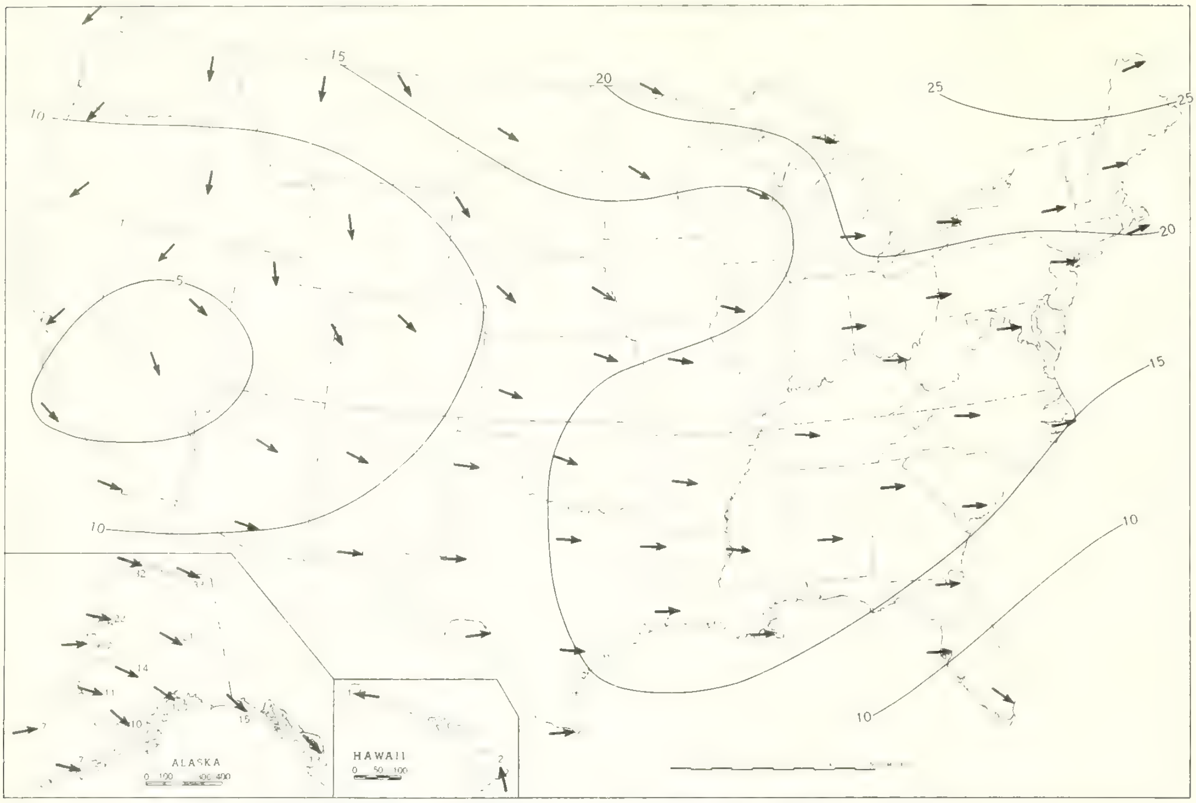
See Chart XI for explanation of map.

Chart XVI. 100-mb. Surface, 1200 GMT, November 1966. Average Height and Temperature, and Resultant Winds.

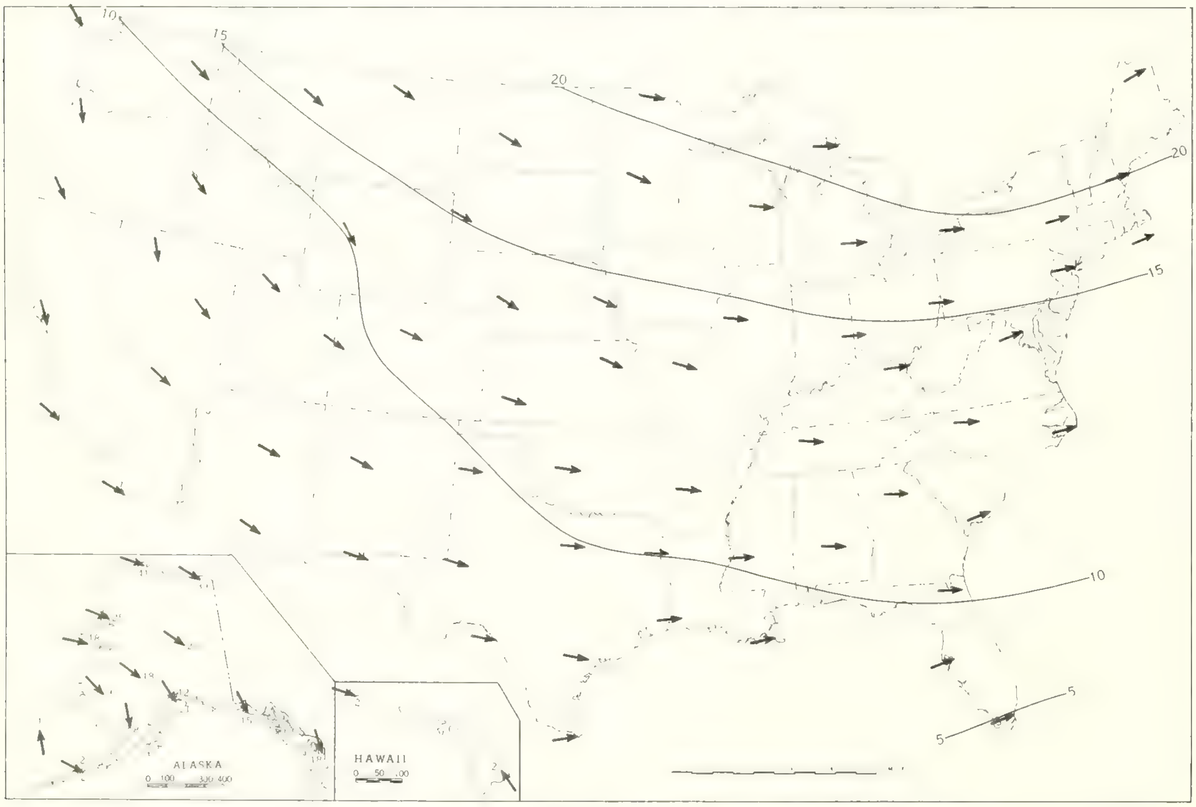


See Chart XI for explanation of map.

Chart XVII. A. 50-mb. Surface, 1200 GMT, November 1966. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, November 1966. Resultant Winds.



Wind speed (isotachs) in knots. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 7 No. 12 DECEMBER 1966

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Heavy snowfall many areas.
2. Warmest December weather of century Northeast second week.
3. White Christmas North and also in some southern areas.
4. Tornado outbreak in Midwest 7th.

TEMPERATURES.--Temperatures fluctuated widely during December 1966, but averaged near normal - slightly above in parts of both the Far West and northeast quarter of the 48 States and slightly below in most central and sotheastern areas. Above normal temperatures were most persistent in the Pacific Northwest, particularly in central Washington, where only about 6 days were colder than normal, flowers were still in bloom at Yakima at the end of the month, and monthly average temperatures were as much as 6° above normal. The last decade was unusually cold in the southern portion of the Far West, with freezing occurring nearly everywhere except along the coast.

December began cold east of the Rockies, warmed up to above normal except in the northern Great Plains the second week, was cold only in the Gulf States the third week, and warm only along the northwest Canadian border the rest of the month. During the first 4 days of the month the East was in the grip of a cold wave, with freezing to central Florida and almost to the southern tip of Texas, and subzero minima in north-central and northeastern interior areas. On the first day the temperature did not rise above -6° at International Falls, Minn.

A warming trend began east of the Rockies on the 5th, with temperatures rising to record levels for December in some areas. Syracuse, N. Y., registered 69° on the 8th and 70° on the 10th, the latter the record highest for December. On the 9th, 10th, and 11th a cold front moved from the Great Plains to the Atlantic. This was followed by a surge of cold air from Canada depressing temperatures far below zero in the northern Great Plains. Freezing extended to Brownsville, Tex., on the 12th and 13th, and temperatures in the South were below normal for several days.

Late in the third week chinook winds raised maxima into the 50's and 60's in the western Great Plains for 2 or 3 days. Even in the rest of the Country unseasonably mild weather was the rule until the beginning of the fourth week when an arctic air mass began pushing into the north portion of the 48 States.

The last 10 or 12 days were cold everywhere except the northwest Canadian border area, where temperatures were above normal. During this period subzero temperatures were common in the central and northern Great Plains, and minimum readings in the 20's were reported as far south as southeastern Arizona and in the Everglades of Florida.

Scattered stations reported record high temperatures for various dates during the first half of the month. Among these were Yuma, Ariz., 83° on the 6th; Cairo, Ill., 71° on the 7th; Tulsa, Okla., 80° on the 7th; Boston, Mass., 70° on the 9th; Richmond, Va., 75° on the 10th; and Cleveland, Ohio, 67° on the 8th. Several date lows occurred among which were 19° at El Paso, Tex., on the 17th; 26° at Phoenix, Ariz., on the 29th; 21° at San Antonio, Tex., on the 11th; and 4° at Richmond, Va., on the 27th.

PRECIPITATION.--Precipitation was near to above normal except below in the lower Great Plains and southern Florida. West of the Continental Divide, precipitation occurred most of the first 10 days of the month and continued nearly all month in the Pacific Northwest. In the southern portion of California's Central Valley flooding along the Tule River Valley near Porterville at the beginning of the month caused damage - based on early estimates - of $2 million, and in the northwestern part of the State minor flooding was reported along the Eel River. Monthly totals of 2 inches or more exceeded 200 percent of normal in western Colorado, Utah, northern Arizona, and parts of Nevada. For Milford, Utah, 2.11 inches was the greatest December total recorded there in the past 61 years.

Precipitation was well above normal in the Mississippi Valley and Great Lakes region, with monthly totals ranging from 150 to 250 percent of normal in Indiana, Lower Michigan, northwestern Ohio, eastern Illinois, and south-central Wisconsin. Heaviest amounts (storm totals up to 7 inches locally) fell in this area during the latter part of the first decade and caused considerable flooding in Ohio, Indiana, and Tennessee.

In most of Texas and New Mexico, extreme southern Arizona, eastern Colorado, and western Oklahoma, precipitation was less than 50 percent of normal and some stations reported no measurable amounts. This was the third consecutive dry month in most of these areas, and winter grains needed more moisture. At Roswell, N. Mex., only a trace of precipitation was recorded during a 102-day period ending December 31.

SNOW.--Snowfall was abnormally heavy in many northern sections where snowfall is a common December phenomenon. In the Northeast record December totals were recorded by a number of stations among which were Burlington, Vt., 36.2 inches; Reading, Pa., 27.1; and Lynchburg, Va., 17.9 inches. Washington, D. C., measured 16.1 inches for the month, only 0.1 inch below the December record. Heavy snow fell at most northeastern stations at least three times during the month. Burlington, Vt., reported heavy snowfall December 1-2, 24-25, and 29, and Roanoke, Va., on the 13th, 23d-24th, and 28th. The heaviest and most widespread falls occurred on the 24th and 25th when over a foot was reported by scattered stations in the Appalachians and from southeastern Pennsylvania northward through New York and New England. Philadelphia, Pa., measured 12.4 inches on the 24th and Albany, N. Y., 18.3 inches on the 24th and 25th. On Christmas Day snow covered most of the northern half of the Nation.

Snowfall on December 1-2 over northeastern Ohio reached depths ranging between 26 and 30 inches in the northeast portion of Ashtabula County, 10 to 18 inches in Lake County, and 12 to 14 inches in the northern portion of Geauga County. Erie, Pa., measured a total of 16.5 inches for the 1st and 2d. Falls during this storm on the 1st and 2d were extremely heavy just south of Buffalo, N. Y., in Chautauqua, Cattaraugus, and southern Erie Counties. Mayville, N. Y., located in Chautauqua County about 8 miles from Lake Erie, measured 54 inches during the storm; more than 200 persons were stranded and the New York State Thruway was closed from Silver Creek, N. Y., to the Pennsylvania line for 13 hours.

In central and upper portions of the Great Plains and Mississippi Valley moderate to heavy snow fell on the 10th and 11th and light falls were frequent from the 23d until the end of the month. On the 23d and 24th some stations in the Ozark region of Arkansas and Missouri reported up to a foot or more of snow. A storm swept out of the Southwest on the 27th and moved over the lower Great Plains to the middle Mississippi Valley and across the Great Lakes by the 30th, leaving a heavy snow cover in the central and lower Rockies. Blizzard conditions developed over the central Great Plains, and snowfall ranged from 8 to 12 inches over parts of Kansas and Nebraska and northeastward across southern Iowa and northern Missouri to southern Wisconsin and northern Illinois.

Snowfall in the Far West was also normal or above in many sections. Falls were frequent in the Cascades and occurred at intervals in the Sierras and Rockies. At the beginning of the month snow depths ranged up to 40 inches in the Sierras, 50 in the Cascades, and to as much as 2 feet in the Rockies. Depths doubled during the month in the Cascades and Rockies, but remained about the same in the Sierras.

SEVERE STORMS.--During a frontal passage in the Midwest on December 7, damaging tornadoes occurred in Missouri, Illinois, and Indiana. Other storms during the month were of the wintertype - snow, glaze, and occasional high winds.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or with a measurable amount the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - **Station Pressure**" table of the annual issue of this publication.
Z Sun continuously below horizon.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or with a measurable amount the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

Z Sun continuously below horizon.

HEATING DEGREE DAYS

L Local flooding

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the U. S. Weather Bureau monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5,000,000
7	$5,000,000 to $50,000,000
8	$50,000,000 to $500,000,000
9	$500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

DECEMBER 1966

Elmer R. Nelson, Office of Hydrology

Severe flooding occurred in southern California during December. Flooding along the Kaweah, Tule, and Kern Rivers was the highest of record. The peak flow of the Tule River at Success Dam was more than twice the previous record and on the Kern River at Isabella Reservoir about 2.5 times its previous record. Preliminary estimates of damage on the Kaweah, Tule, and Kern Rivers were placed at $16.7 million. The total flood damage in the Salinas Basin was estimated at $2 million.

Major flooding occurred in northern Arizona, southern Nevada, and southwestern Utah. Flooding on the Virgin River was one of the largest floods on record.

ST. LAWRENCE DRAINAGE

Lake Erie.--Heavy rains, with heavy thunderstorm activity, from the 7th to the 10th caused 3 to 7 feet of overflow in the Maumee River Basin in Indiana and Ohio. The rainfall on the 7th and 8th totalled around 5 inches and caused a rapid rise of the Maumee River to above flood stage. Many homes in the River Haven area between Ft. Wayne and New Haven, Ind., were surrounded by water, but only minor damage resulted. Several families were evacuated and household contents were protected. At Grand Rapids, Ohio, 75% of the homes (with basements) experienced flooding due to the downpour. By noon of the 9th, several stores moved or protected merchandise and more than a dozen families were evacuated from their homes. Many thousands of dollars damage resulted to roads and dikes. At Lima, Ohio, two persons lost their lives in the Ottawa River while trying to drive their car through the swollen stream. In addition to river overflow, the heavy showers caused surface and basement flooding in many cities throughout the area.

ATLANTIC SLOPE DRAINAGE

Heavy rainfall over New Jersey on the 29th plus partial melting of snow cover, varying from 6 inches to nearly 2 feet, caused some flash flooding of small streams. Larger streams crested at 3/4 bankfull or slightly above. Flows in these streams remained high for several days.

The Lumber River at Lumberton, N. C., rose slowly to above flood stage on the 30th. Light overflow continued into January. No damage or inconvenience resulted from the flooding.

MISSISSIPPI SYSTEM

Upper Mississippi System.--A period of general and rather heavy rain (2 to over 6 inches) over Illinois, beginning on the 4th and continuing to the 8th caused flooding on the Sangamon and Kaskaskia Rivers. The Sangamon River equalled flood stage at Monticello, Ill., on the 10th and 11th and exceeded flood stage at Riverton, Ill., from the 8th to the 18th cresting on the 12th 5.6 feet above flood stage. The Kaskaskia River exceeded flood stage from 4 to 9 feet in the reach from Shelbyville to Carlyle Dam, Ill., between the 8th and 14th. Because of the season of the year, flood damage was limited mostly to winter grains and pastures in bottom-land areas.

Navigation along the Mississippi River ended at St. Paul, Minn., on the 4th, at La Crosse, Wis., on the 7th and at Guttenberg, Iowa, on the 8th.

Missouri Basin.--High water was reported along the Yellowstone River in Montana during December due to icejams. At Miles City, the river reached a level of 11.9 feet, 1.1 feet below flood stage. The river remained within its banks at all points.

Minor flooding was reported along the main stem of the Missouri River in North Dakota on several days during the month due to ice action. Only a few acres of private land was inundated. The amount of damage was insignificant. The main stem did not freeze over in the reach below the North Dakota-South Dakota state line. Ice increased and developed downstream, becoming heavy by the end of the month, with 50% coverage as far as St. Charles, Mo., near the mouth. Blocking action developed the night of the 28th and 29th, with fluctuations of 3 to 5 feet in the Kansas City, Mo., area.

Ohio Basin.--Considerable flooding occurred around Chautauqua Lake, N. Y., in the upper Allegheny Basin during the second week of December. This flooding was due to the rapid melting of the snow which was extremely heavy, measuring up to 54 inches near Mayville, N. Y. Some rain accompanied this snowmelt. Main flood damage occurred in low areas.

Moderate rain showers from the 6th to the 8th, accompanied by snowmelt over the upper Allegheny Basin caused flooding along French Creek at Meadville, Pa., from the 8th to the 10th. The flooding was confined to summer cottage areas. Many secondary roads along with Route 19 were closed and traffic rerouted. Flood damages were minor.

Flooding in the Scioto Basin in Ohio from the 9th to the 14th was due to recurring rains from the 5th to the 10th. Heavy rain and some scattered thunderstorms occurred late on the 9th or early on the 10th. This flood ranked among some of the higher floods of past Decembers, but did not reach serious proportions. Some secondary roads were closed by the high water. Small fields of unharvested corn were partly inundated.

Streams in the Wabash Basin in Indiana rose to the highest stages in two or three years from the heavy rains from the 4th to the 9th. Daily rainfall amounts reported at most stations totalled more than 3 inches. More than 4.5 inches was reported along much of the Wabash. Several stations reported more than 6 inches of rain during this period. Flood crests ranged from 10 to 12 feet above flood stage and were highest along the Wabash and lower White Rivers. Thousands of acres of cornland were inundated, resulting in considerable damage to an estimated 20 to 25 percent of the cornland which remained unpicked. Many state and county roads were closed by the high water. A washout near Lafayette, Ind., derailed a train. Near Montezuma, the water overtopped low levees, flooding wide areas of farmland.

The Stones River at J. Percy Priest Dam, Tenn., exceeded flood stage by 6.8 feet on the 10th. It remained above flood stage for about 36 hours. This flooding was due to heavy rain on the 8th to the 10th, which totalled around 4.5 inches in the middle and upper portions and 2.5 to 3 inches in the lower portion. Damages were light with little, if any, crop damage because of the season of the year. Heavy rain (1 to 1.5 inches) in the Cumberland Basin above Barbourville, Tenn., on the 27th to the 29th, plus snowmelt caused the main stem to exceed flood stage by 1.3 feet at Barbourville on the 29th. The rainfall ranged from 1 to 1.5 inches on the 27th and 28th, plus another 0.5 to 1 inch by the morning of the 29th. Snow fell over the Cumberland Basin on the 24th with amounts ranging from 4 to 10 inches in the upper basin. The snow melted very slowly with 2 to 5 inches remaining on the ground by the morning of the 27th.

Heavy rains beginning during the late afternoon of the 8th and continuing through early morning of the 10th caused 3.5 to 6 feet of overflow along the Duck River in Tennessee. The rainfall averaged 4 to 5 inches with local amounts up to 8 inches. The high water caused the closing of some streets in Columbia, Tenn. The total damages were estimated at less than $5,000.

Some flooding occurred along the main stem of the Ohio River from Dam No. 47 (Newburgh, Ind.,) to Dam No. 50 (Fords Ferry, Ky.,) between the 13th and 22d. This 1 to 5 feet of overflow was due to heavy rains (3 to 5 inches) in Illinois and Indiana from the 4th to the 10th. Corn was still being harvested at the time of the flood. However, losses are not expected to be heavy.

White Basin.--Two- to three-inch rains on the 27th and 28th caused flooding on the Cache River at Patterson, Ark., beginning on the 29th. The flooding continued into January, cresting nearly 2 feet above flood stage on January 4.

Arkansas Basin.--No significant runoff was noted. Extremely low soil moisture conditions (negative A. P.I.'s) predominated, except in the eastern portion, at the end of the month.

At Pueblo, Colo., the year 1966 was the third driest since 1889. It was the driest year of record above the Kansas-Oklahoma state line.

Lower Mississippi Basin.--Minor flooding occurred on the St. Francis River at Fisk, Mo, on the 11th to the 13th. Very little if any damage resulted from this overflow.

GULF OF CALIFORNIA DRAINAGE

Colorado Basin.--Major flooding occurred in northern Arizona, southern Nevada, and southwestern Utah between the 4th and 8th. Streams affected include the Virgin, the Bill Williams, the Verde, and minor tributaries of the Colorado River. Flooding of the Virgin River was described by Nevada authorities as one of the largest floods of record. At Little Field, Ariz., this was the highest recorded flood in the past 30 years. The flow of the Verde River above Horseshoe Dam, Ariz., was measured at 70,000 c.f.s. compared to a maximum of 100,000 c.f.s. on March 3, 1938. This flooding was due to heavy rainfall (5.5 to over 11 inches) from the 3d to the 7th.

Preliminary estimates of flood damage were heavy and placed at $5 million. Flood damages in Arizona, Utah, and Nevada were estimated at $3.1 million and $1.6 million, and $300 thousand, respectively. One death from drowning was reported on the Virgin River in southern Nevada.

PACIFIC SLOPE DRAINAGE

Flooding along the Kaweah, Tule, and Kern Rivers in California from the 5th to the 8th was the severest of record. Some severe flooding also occurred on Poso, Deer, and Caliente Creeks. Minor flooding occurred along the Fresno, and Chowchilla Rivers and the creeks from the foothills of the Kings and San Joaquin Basins. The synoptic situation was such that the heaviest precipitation occurred in the upper reaches of the Kaweah, Tule, and Kern Rivers. Ten to 15 inches of precipitation were measured within a 24-hour period. Runoff was almost instantaneous as this same area had been saturated the previous week. The first flooding occurred on the evening of the 5th in the towns of Three Rivers on the Kaweah, Springville on the Tule, and Kernville on the Kern. This was followed by additional peak flows on the 6th and again on the 7th. The Tule River at Success Dam had an estimated peak flow of 56,000 c.f.s., a little more than twice the previous record. There was 9,650 acre-feet of water behind Success Dam before the storm. Within 40 hours it filled to its capacity of 85,440 acre-feet and began running through the spillways. Uncontrolled releases continued from the 6th through the 10th. The Kern River at Isabella Reservoir had a peak of 102,000 c.f.s. or about 2.5 times its previous record. On the Keweah, there was 8,800 acre-feet behind Terminus Dam at midnight on the 4th. By the night of the 7th, it had filled to within 15 inches of its capacity of 150,000 acre-feet.

The greatest devastation occurred above the dams. At least 20 to 25 homes were lost, and several trailer courts were destroyed. Topsoil was removed from farmlands along the rivers and river channels were altered. Roads were washed out and undercut in innumerable places; at least 10 bridges were destroyed. The main right-of-way of the Santa Fe and Southern Pacific Railroads was damaged, halting train service for several days, while repairs were made. Citrus groves were flooded and a few trees near the foothills were damaged or lost. Barley fields in the vicinity of Tulare Lake was inundated. Communities in the foothills were isolated and helicopter rescue and supply lines were established by the military over a two-day period. A fish hatchery on the Kern River was destroyed and a million small trout were washed into Isabella Reservoir. The town of Springville, Calif., lost its water and sewer system, and was one of the hardest hit. Elsewhere in the foothill communities, private wells were contaminated and had to be purified. Most of the town of Lamont, Calif., was under 18 inches of water as Caliente Creek overflowed. Three lives were lost during these floods. Preliminary estimates of damage were placed at around $18 million.

Moderate rises occurred on streams in the lower Sacramento and northern San Joaquin Basins from the rains on the 5th to the 7th. Overflow into the Sacramento bypass system occurred at Colusa, Tisdale, and Fremont Wiers, but stages on main streams were far below flood stage. Some minor surface flooding occurred due to poor drainage.

Very heavy rains between the 4th and 6th produced minor to moderate flooding on the Russian River in the Guerneville, Calif., area and along much of the Salinas and its tributaries. Some flooding occurred in Marin County, just north of San Francisco along Corte Madera Creek and along coastal streams. Streams in the Salinas Basin, where the heaviest rain occurred, began overflowing their banks early on the 6th and crested in the afternoon of that date. Santa Margarita Dam on the Salinas, with a capacity of 28,000 acre-feet, filled rapidly and crested 10 feet above the spillway by late afternoon of the 6th. More than 15 inches of rain occurred at Santa Margarita, 5 miles northwest of Santa Margarita Dam, from the 3d through the 7th. The crest reached the Bradley gaging station early on the morning of the 7th, cresting at a stage of 15.9 feet, the highest stage of record since the gage was installed in 1948. This stage was almost 3.5 feet higher than the previous record established in April 1958. The overflow at Wunpost inundated many oil wells operating in the lowlands along the river, filling them with sand and making them inoperable. The damage to the oil industry was estimated at about one-half million dollars. San Lorenzo Creek which enters the Salinas River at King City, flooded the city golf course and deposited a heavy layer of silt on the course. A number of homes in the Arroyo Seco area were flooded by the overflow from Arroyo Seco Creek, which reached a crest of 16.3 feet at the Middle Bridge USGS gaging station during the afternoon of the 6th. This crest moved into the Salinas River on the evening of the 6th, causing a primary and relatively flat crest at the Gonzales and Chular Bridges that night. It continued to move slowly and reached Spreckles Highway Bridge at 8 p.m. on the 7th with a crest stage of 18.9 feet. The main crest from the headwaters area reached the Spreckles Highway bridge at 8 a.m. on the 9th at a stage of 22.7 feet. The main crests at all three bridges - Gonzales, Chular, and Spreckles Highway, were about 3.5 feet higher than their primary crests. The agricultural losses in the Salinas Basin, estimated at $ 1 million was the greatest since the February 1938 flood. About 20,000 acres were flooded of which 6,800 acres were in cropland. About 4,500 acres of the flooded cropland were in the area from Soledad downstream through Spreckles and the remaining 2,300 acres south of Soledad. Based on reports and preliminary survey made by the Corps of Engineers, the total flood damage was estimated at around $2 million. Only minor damage resulted from the flooding in the Russian Basin. A few summer cabins were flooded.

Heavy rain early in December caused the South Fork of the Coquille River at Myrtle Point, Oreg., to exceed flood stage by 1.8 feet on the 5th. The stream went out of its banks on the 4th and receded within its banks on the 5th. Rainfall in excess of 3 inches was reported over much of the mountain areas of western Oregon and from 2.5 to 3 inches along the western slopes of the Cascades on the 4th and 5th. This heavy rain triggered the rise. The main stem of the Coquille River rose to within 1.6 feet of flood stage at Coquille, Oreg., on the 6th. The dry conditions preceding the heavy rain held damages from the flood waters to a minimum.

Heavy rainfall from the 12th to the 14th produced flooding along the South Yamhill and Tualatin Rivers in Oregon. These streams were near bankfull stages due to light to moderate rains during the first seven days of December. Rainfall was particularly heavy along the northern Coast Range in Oregon during the evening and night of the 12th. Timber, Oreg., located in the headwaters of the Coastal Nehalem drainage and adjacent to the Tualatin Basin reported 5.06 inches of rainfall on the morning of the 13th. Precipitation was considerably lighter in the upper Willamette and in Cascade Range tributary basins. Consequently rises on the upper Willamette and Cascade Range tributaries were minor. The Santiam River at Jefferson, Oreg., came within several tenths of bankfull stage on the 13th. The Willamette River at Harrisburg, Oreg., approached bankfull stage twice on the 14th and 15th. At Salem, Oreg., the mainstem approached within 4 feet of flood stage on the 14th. In the Portland Harbor, the high tide effect produced a crest of 11.4 feet at 8 p.m. on the 14th (flood stage 18 feet). The total damages as estimated by the Corps of Engineers was $480,000.

The most extensive flooding in northwestern Washington in December occurred in the Chehalis River Basin. The mainstem crested 5.2 feet above flood stage at Centralia, Wash., on the 14th and was above flood stage from the 13th to the 15th, or about 48 hours. Minor flooding occurred on the Satsop River at Satsop, Wash., on the 13th. Considerable farmland and some roads were under water. The total flood damages in this basin, as estimated by the Corps of Engineers was $592,000. Minor flooding occurred on streams draining into the Puget Sound between the 13th and the 17th. Some minor flooding was also reported on the Willapa River which drains into Willapa Bay. This flooding was due to rainfall from the 10th to the 16th, ranging up to 12 inches at higher elevations.

Note: [illegible] 1200 G. C. T. Pressures shown under station [illegible] are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used [illegible] rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Relative humidity averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° [illegible]

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 [illegible]. Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available. Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G. C. T.

R [illegible] Equipped with lithium chloride hygristor

SOLAR RADIATION DATA

Solar radiation intensities, tabulated in langleys per minute on a surface normal to the direction of the sun.

*	Values corresponding to true solar noon		

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (midnight to midnight) at Huntley, Mont.

DECEMBER 1966

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	55	49	28	28	19	-2	-5	24	20	10	-14	29	36	22	-25	-9	25	71	51	50	31	54	45	34	44	60	38	-48	-27	-28	-45	20

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. **The value represents the total incoming minus the total outgoing radiation of all wave lengths.**

These data are of an experimental nature and are published as received from the Huntley Exp. Station. **The instrument with which they were measured has not been checked by the Weather Bureau.**

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λs Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli-atmo-cms.

Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e. the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm. ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

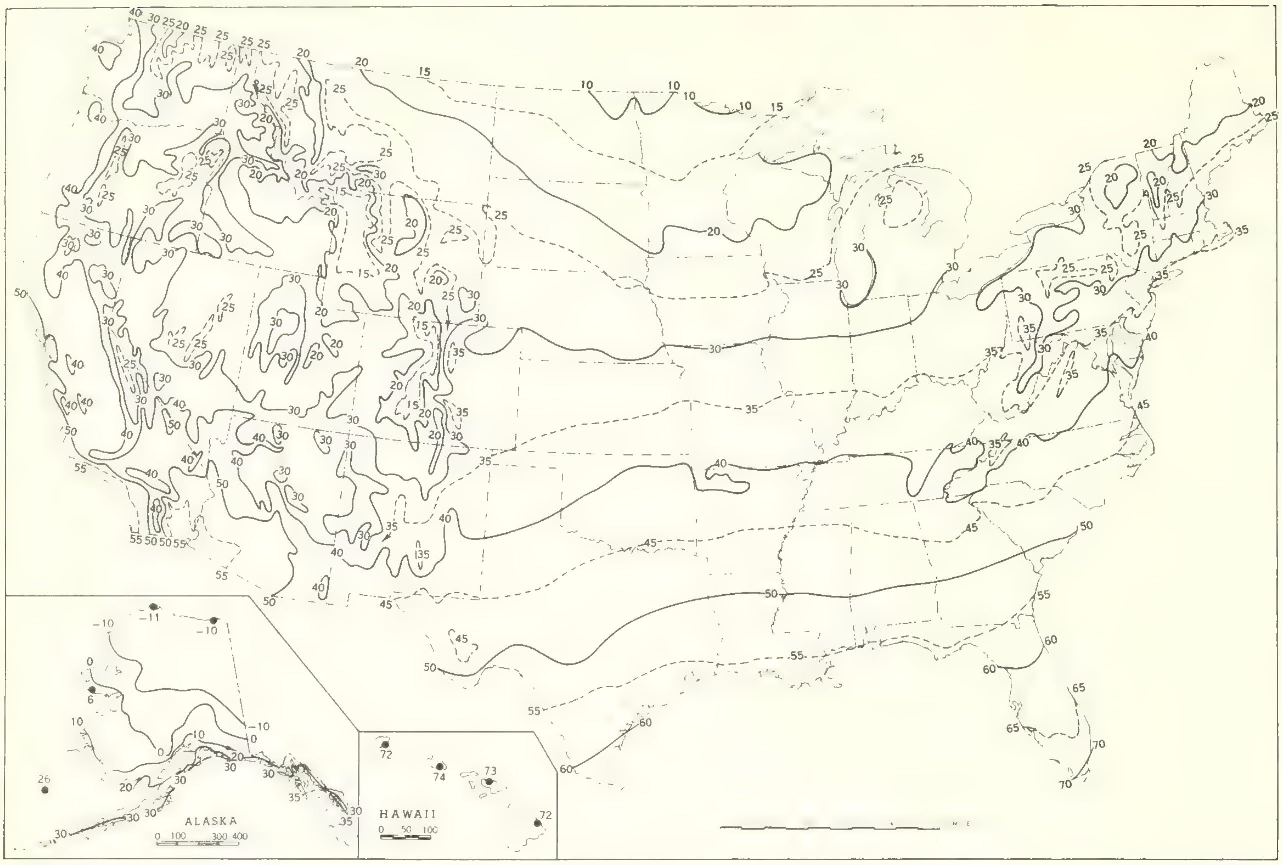
Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), December 1966.



B. Temperature Departure from 30 - Year Mean (°F 1931-60), December 1966.

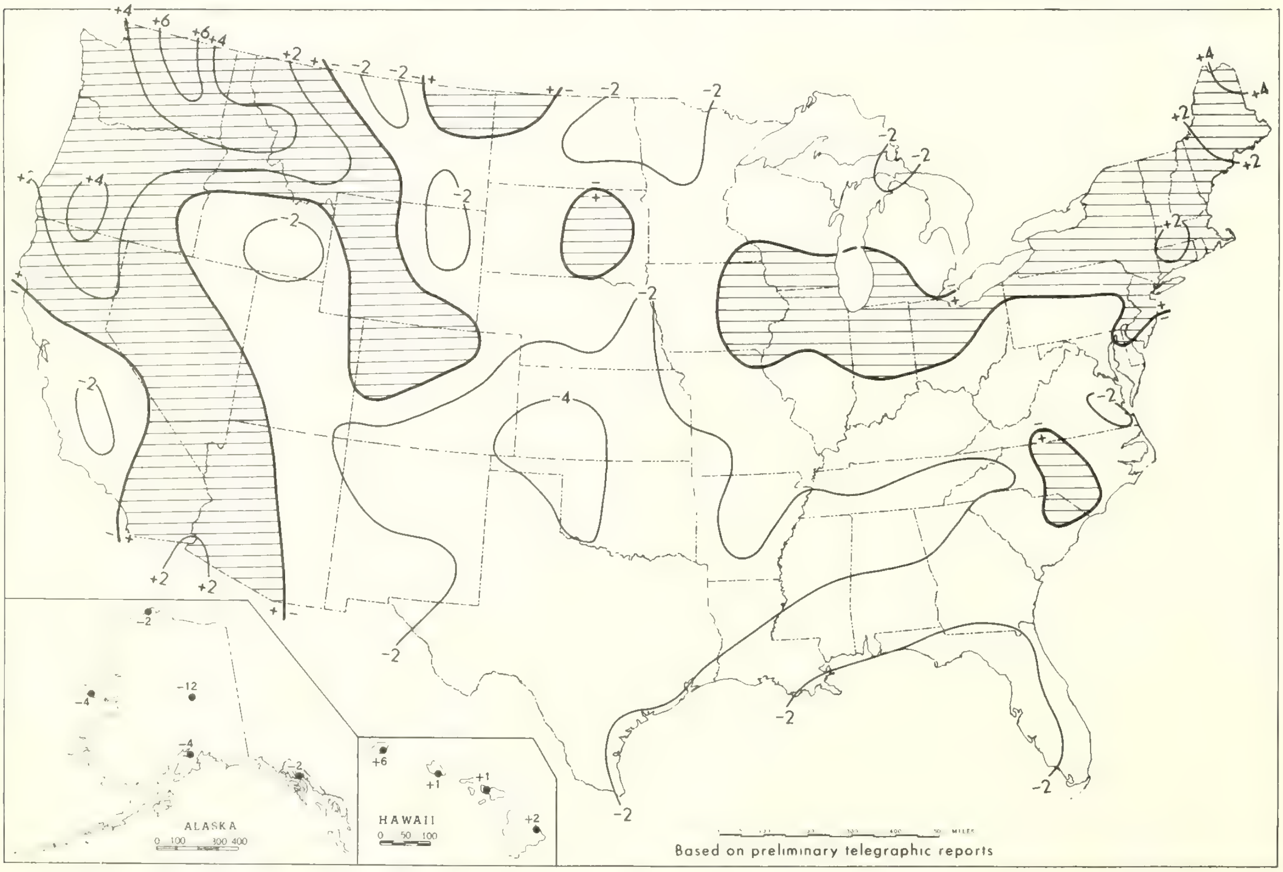


Chart II. Total Precipitation (Inches), December 1966.

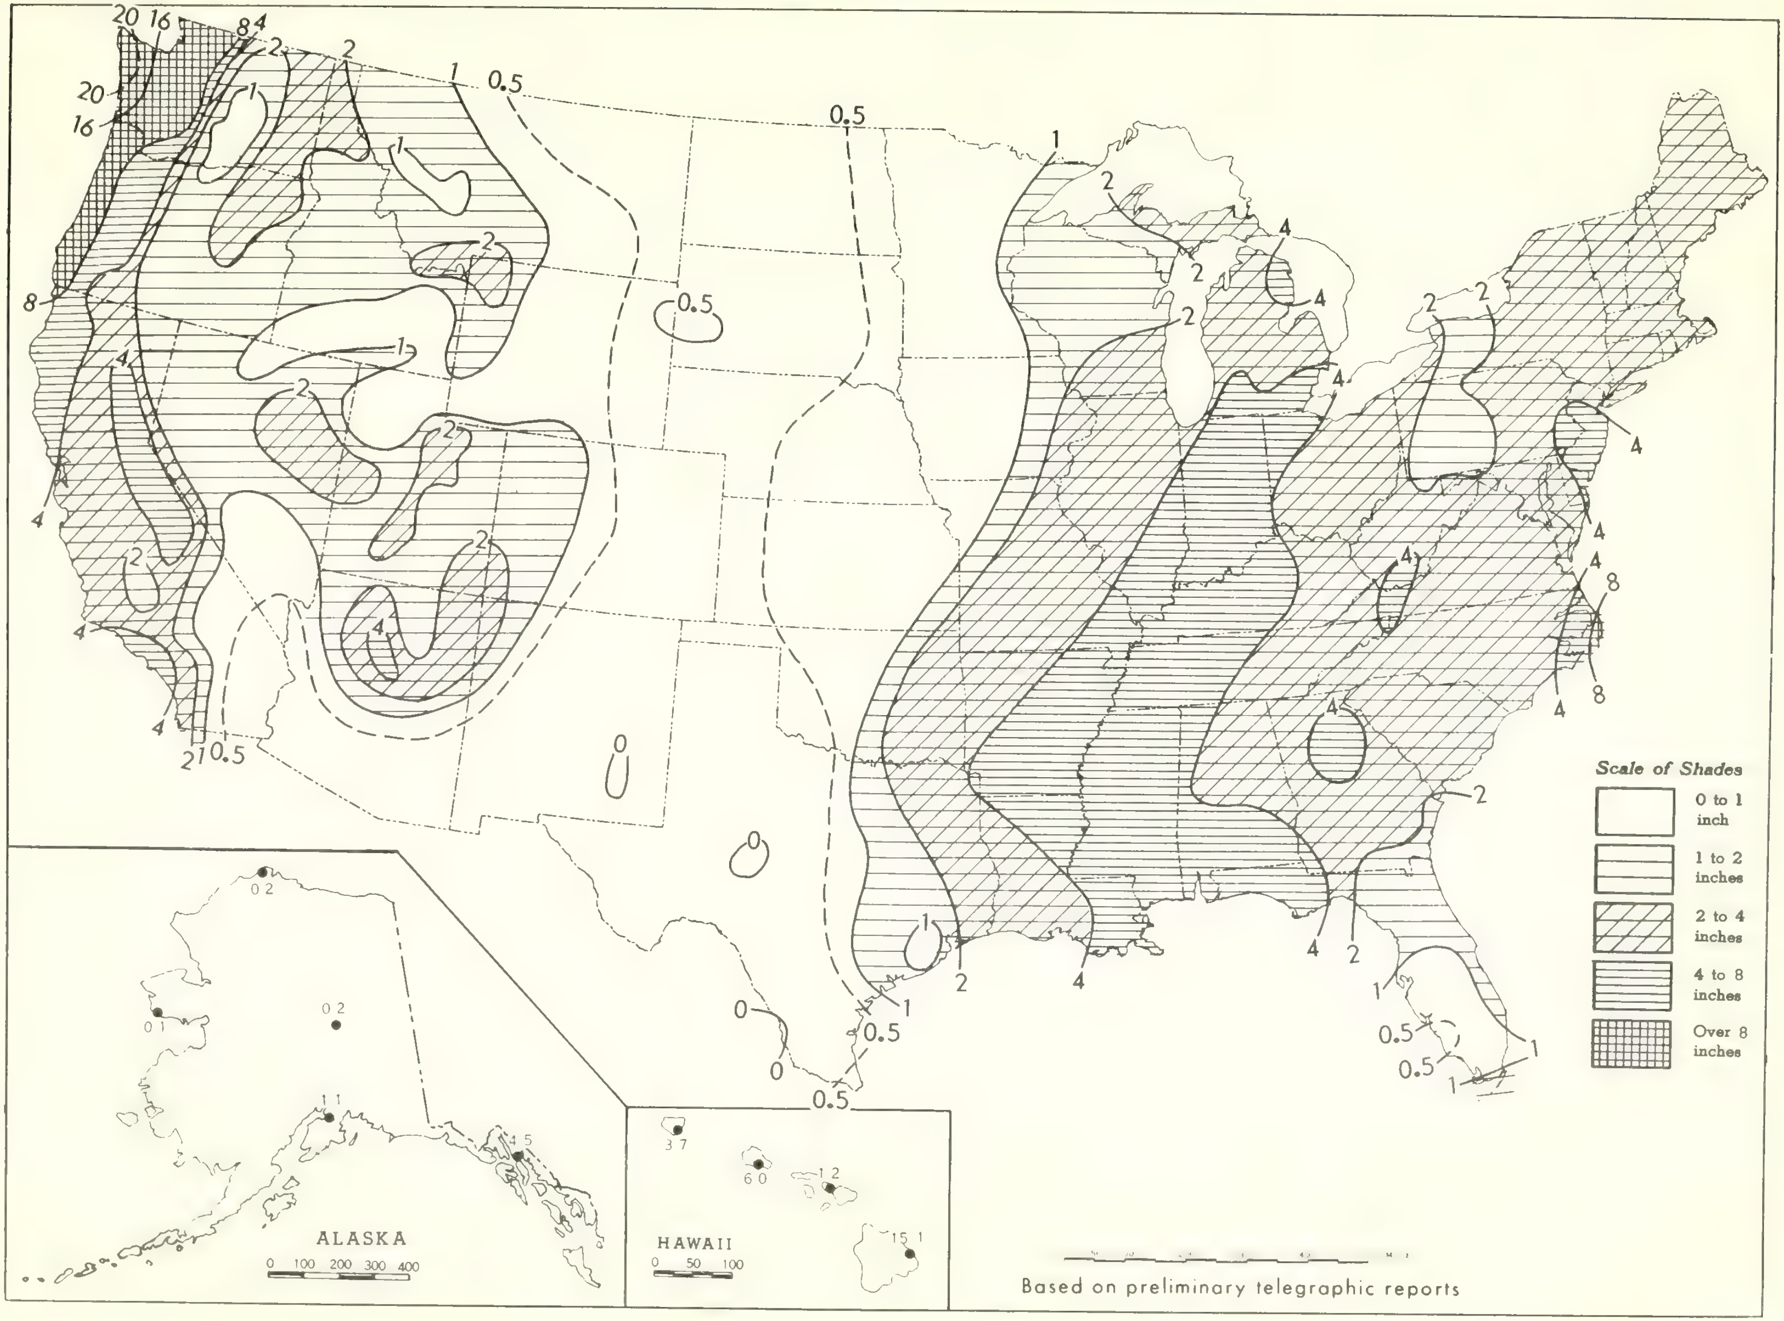
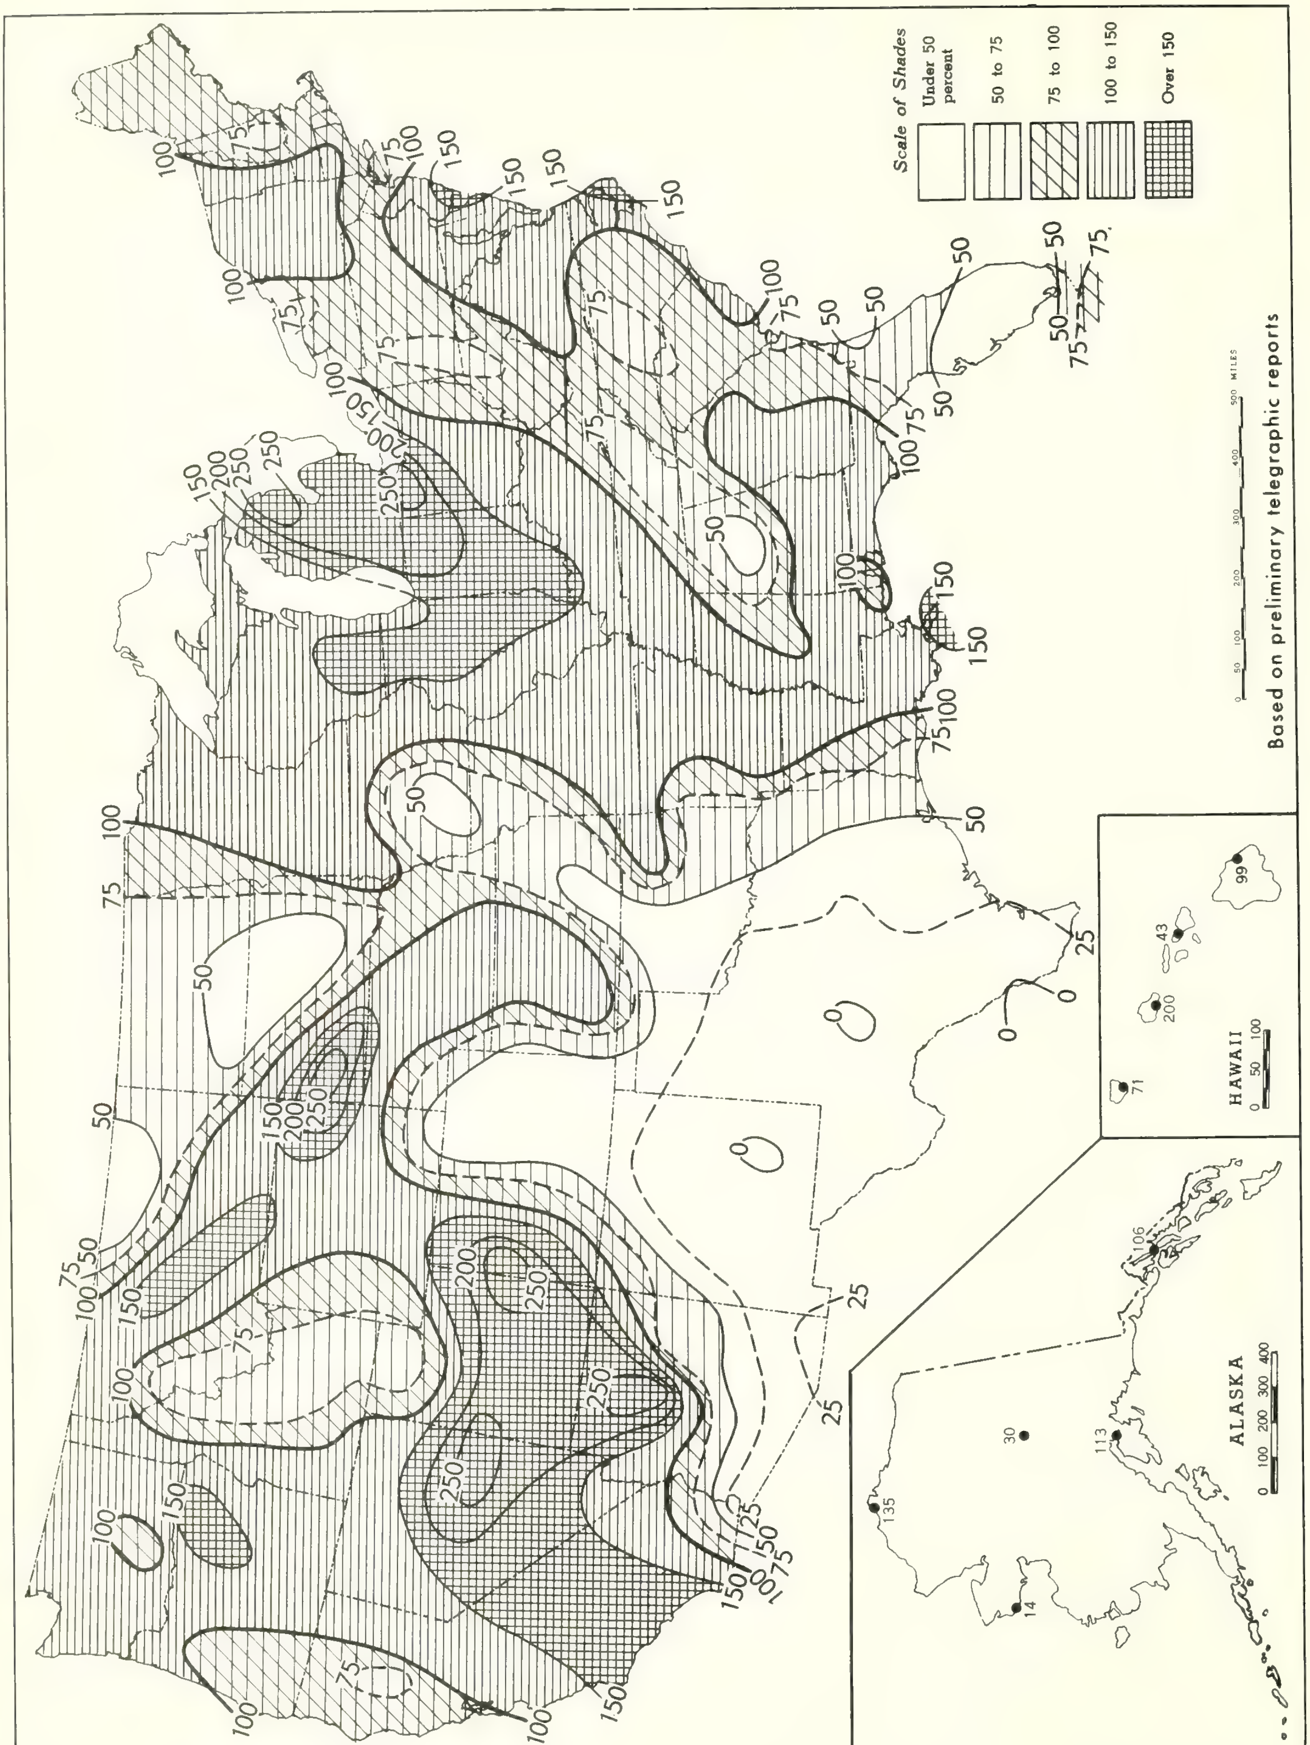


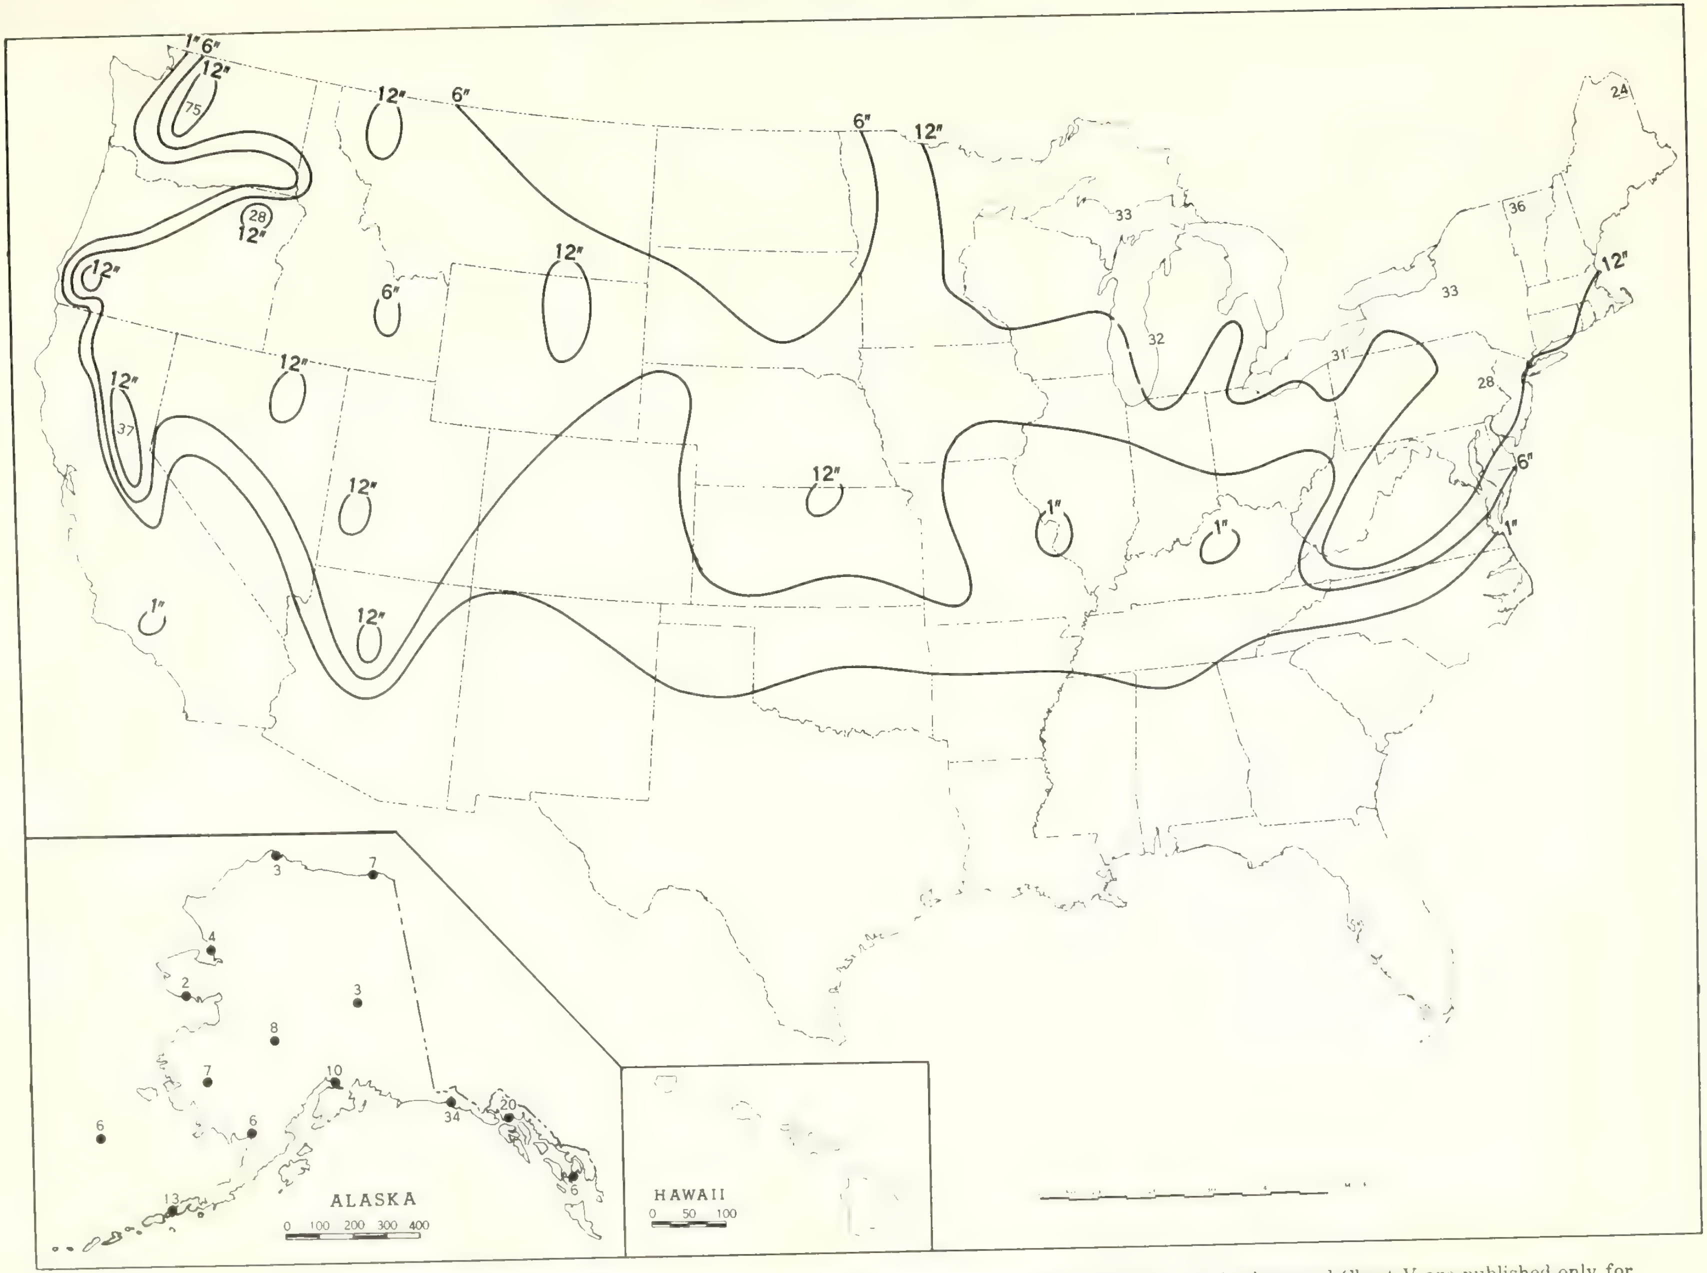
Based on preliminary telegraphic reports

Chart III. Percentage of Normal Precipitation, December 1966.



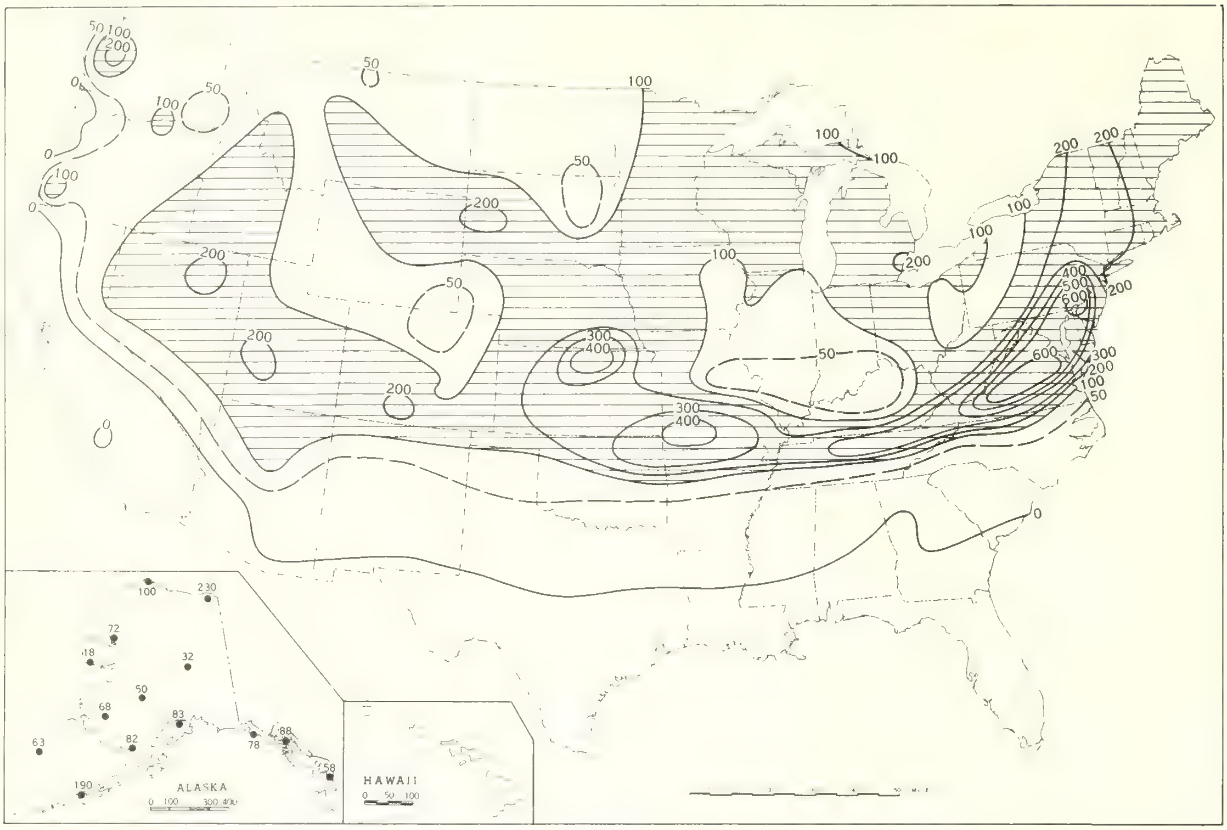
Based on preliminary telegraphic reports

Chart IV. Total Snowfall (Inches), December 1966.

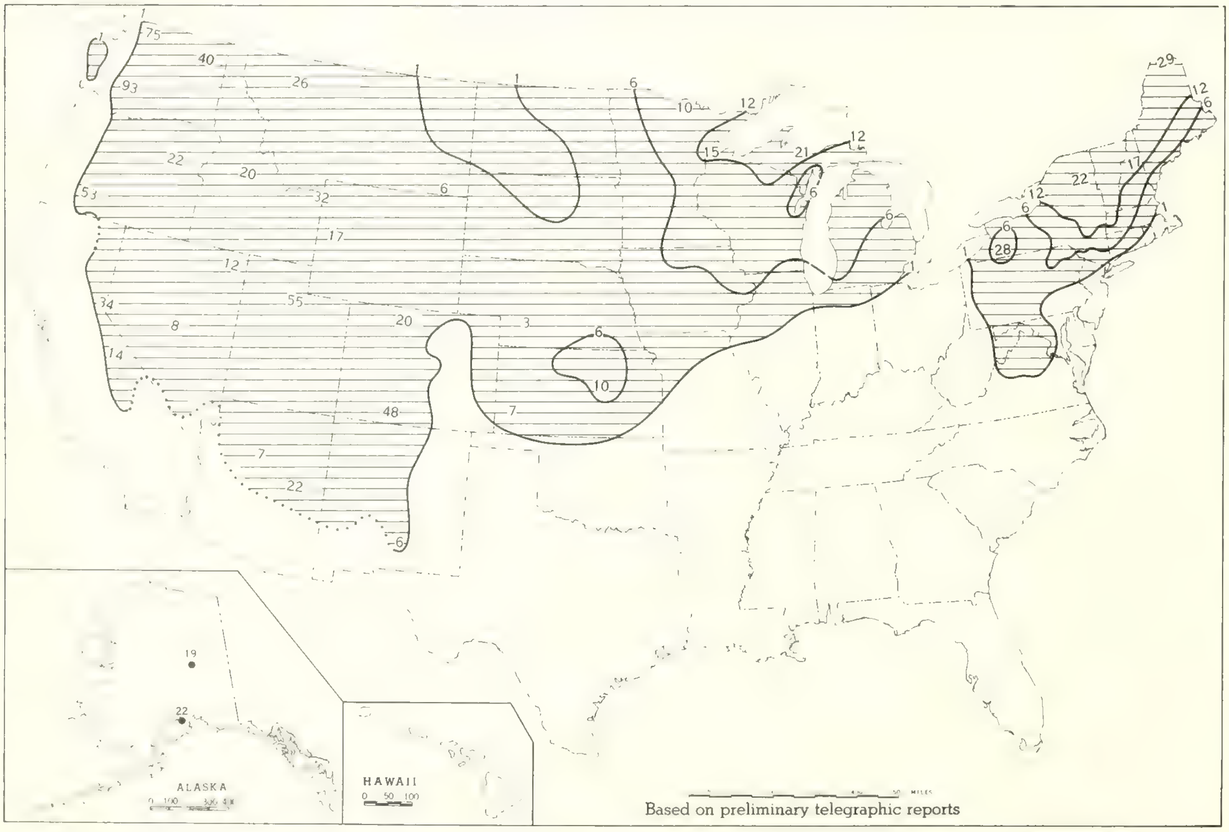


This is the total of unmelted snowfall recorded during the month at Weather Bureau and cooperative stations. This chart and Chart V are published only for the months of November through April although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, December 1966.



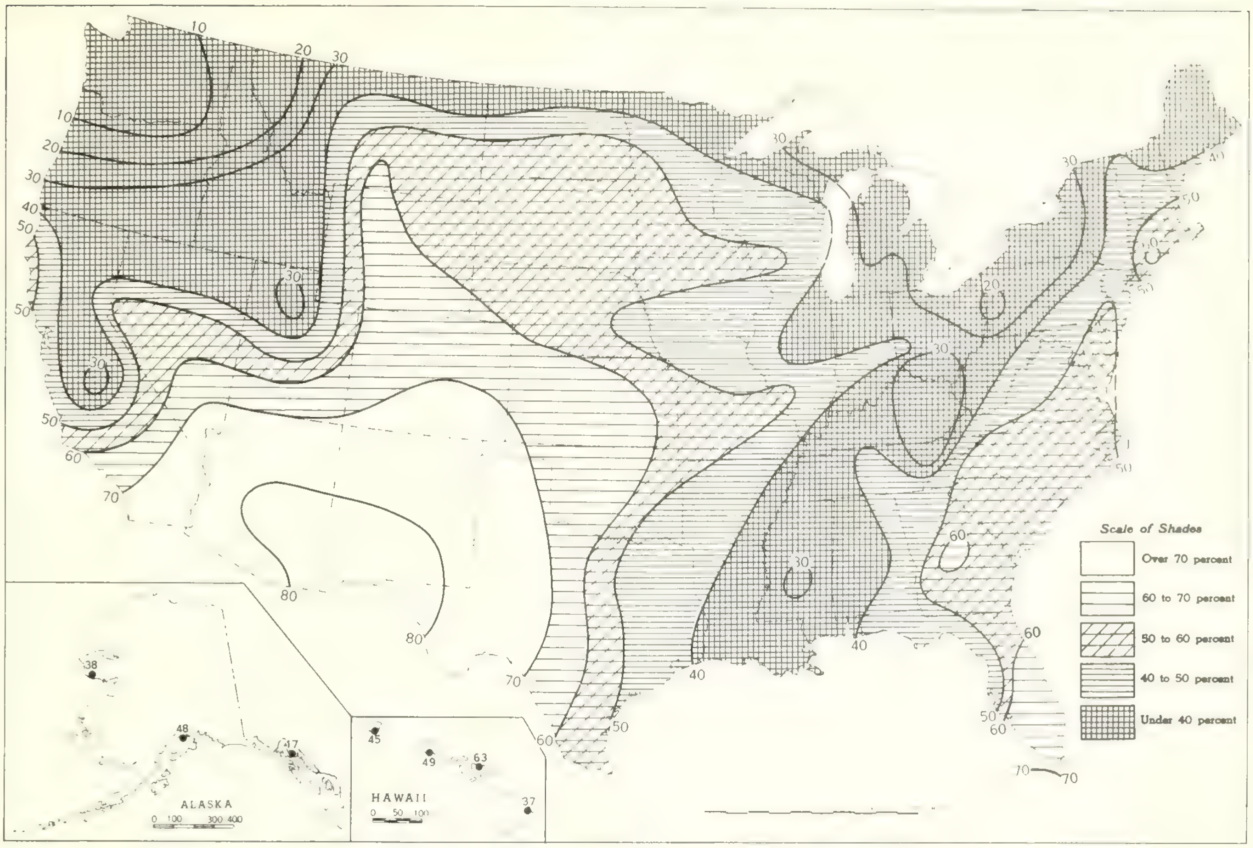
B. Depth of Snow on Ground (Inches), 7:00 a. m. E. S. T., January 2, 1967.



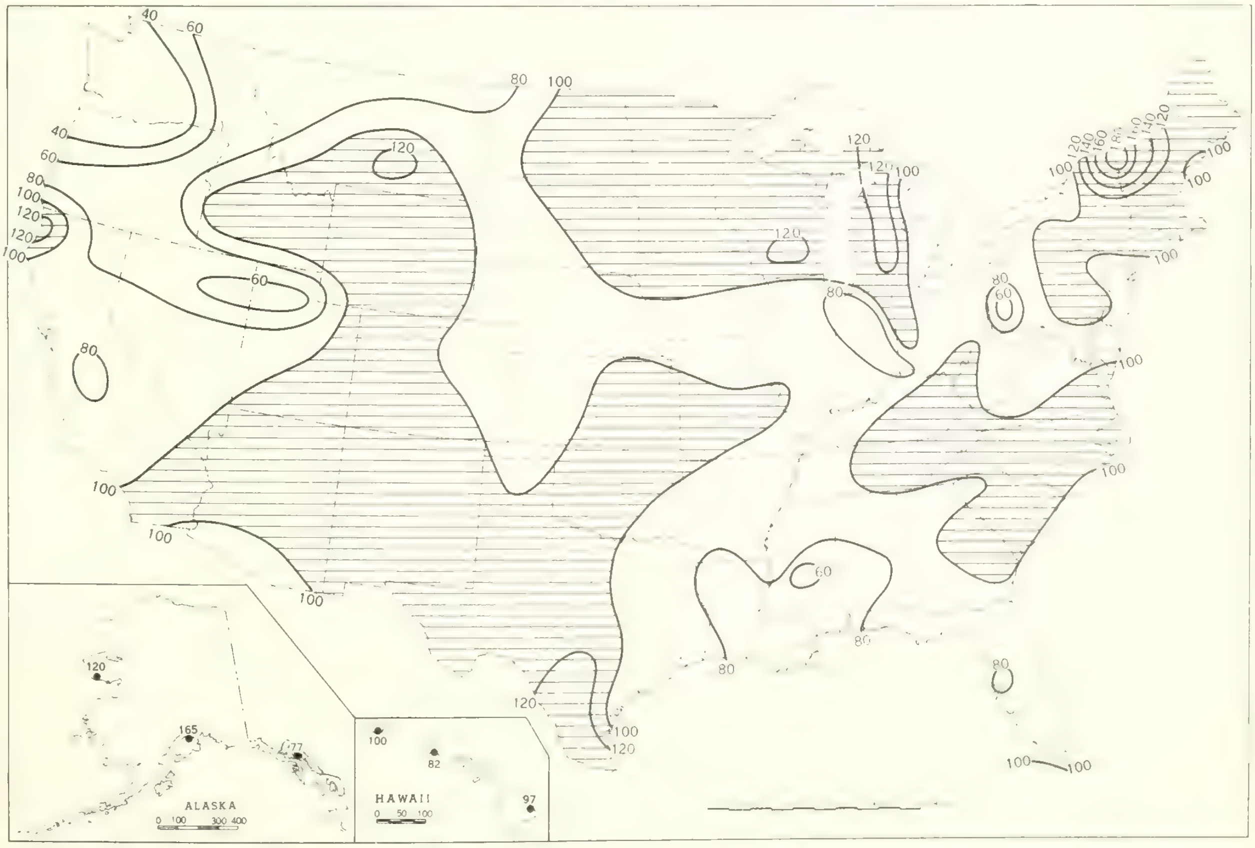
Based on preliminary telegraphic reports

A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, December 1966.

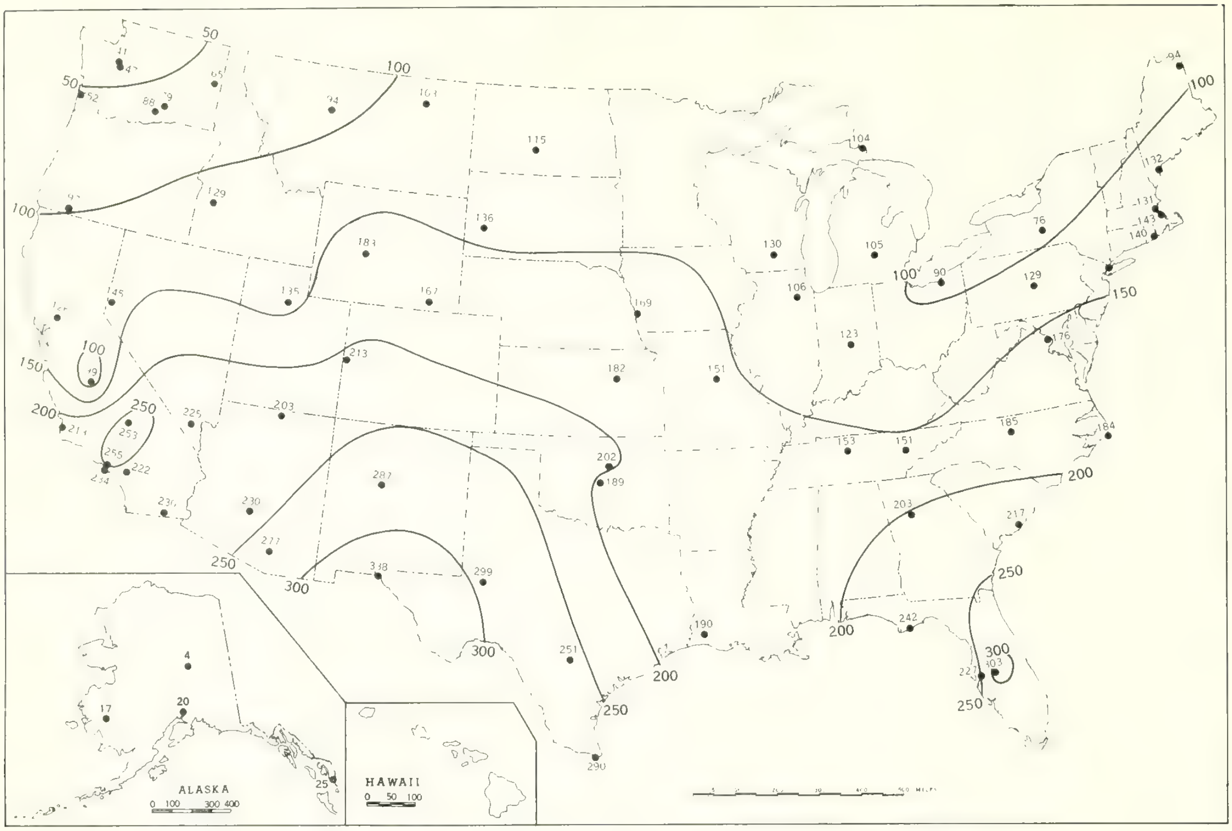


B. Percentage of Mean Monthly Sunshine, December 1966.

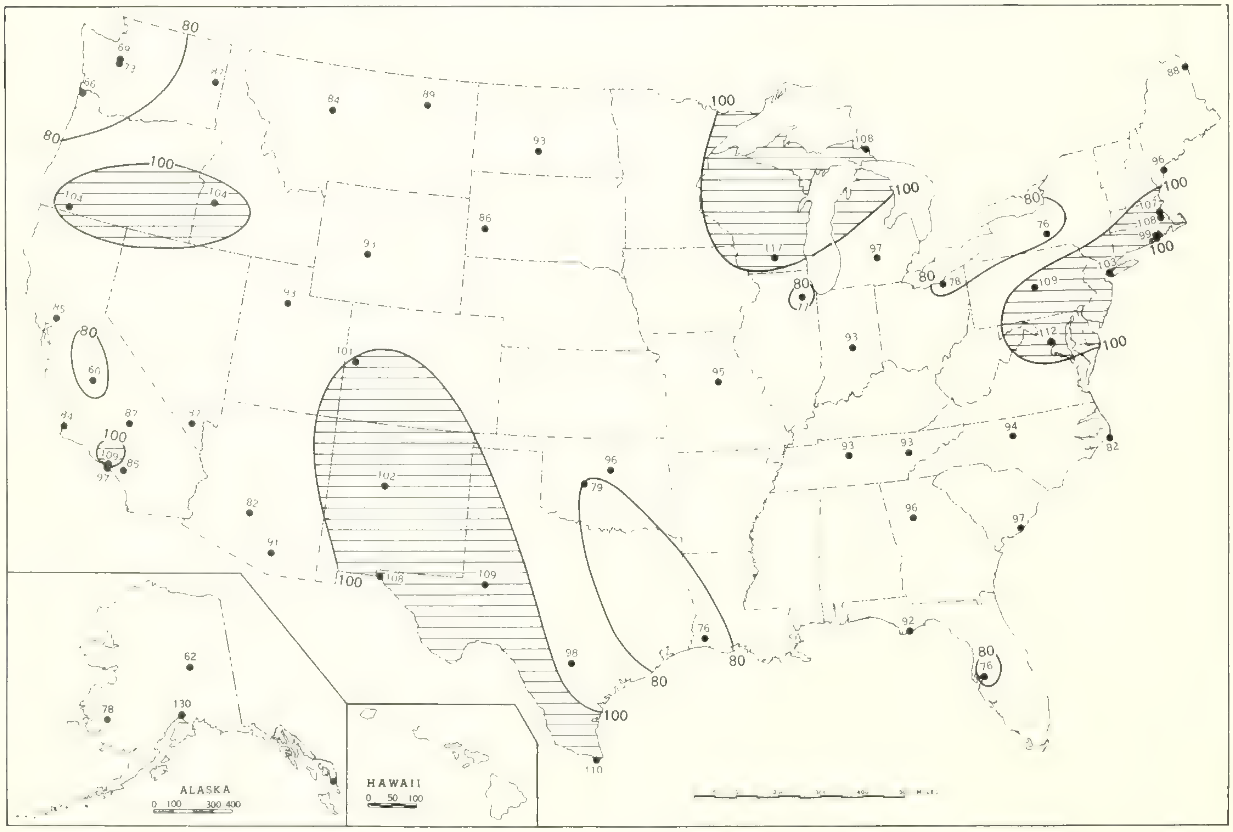


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, December 1966.

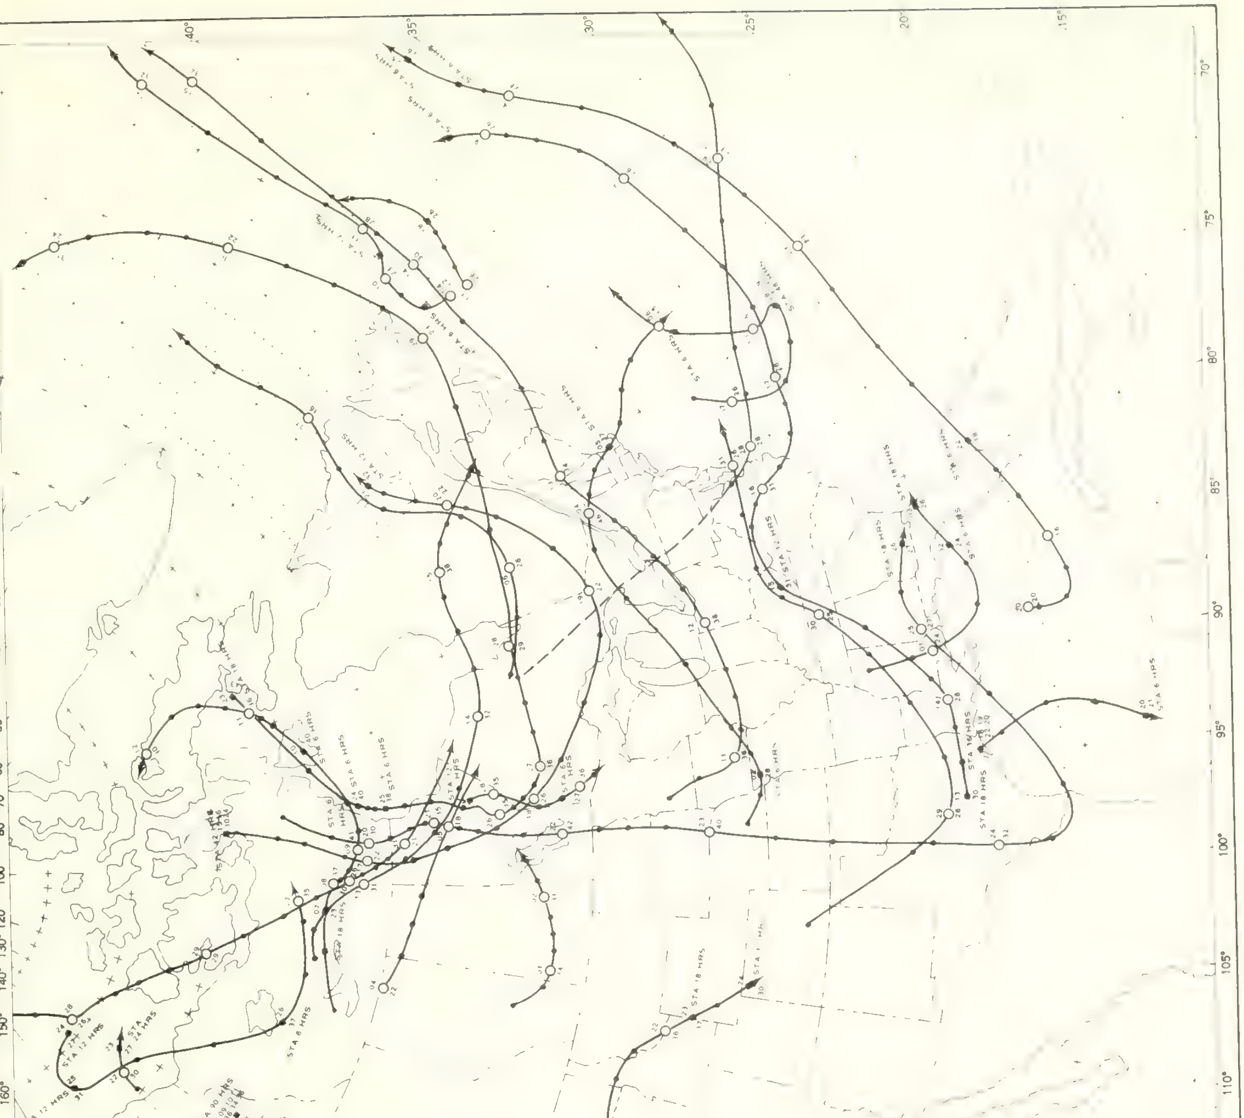


B. Percentage of Mean Daily Solar Radiation, December 1966.



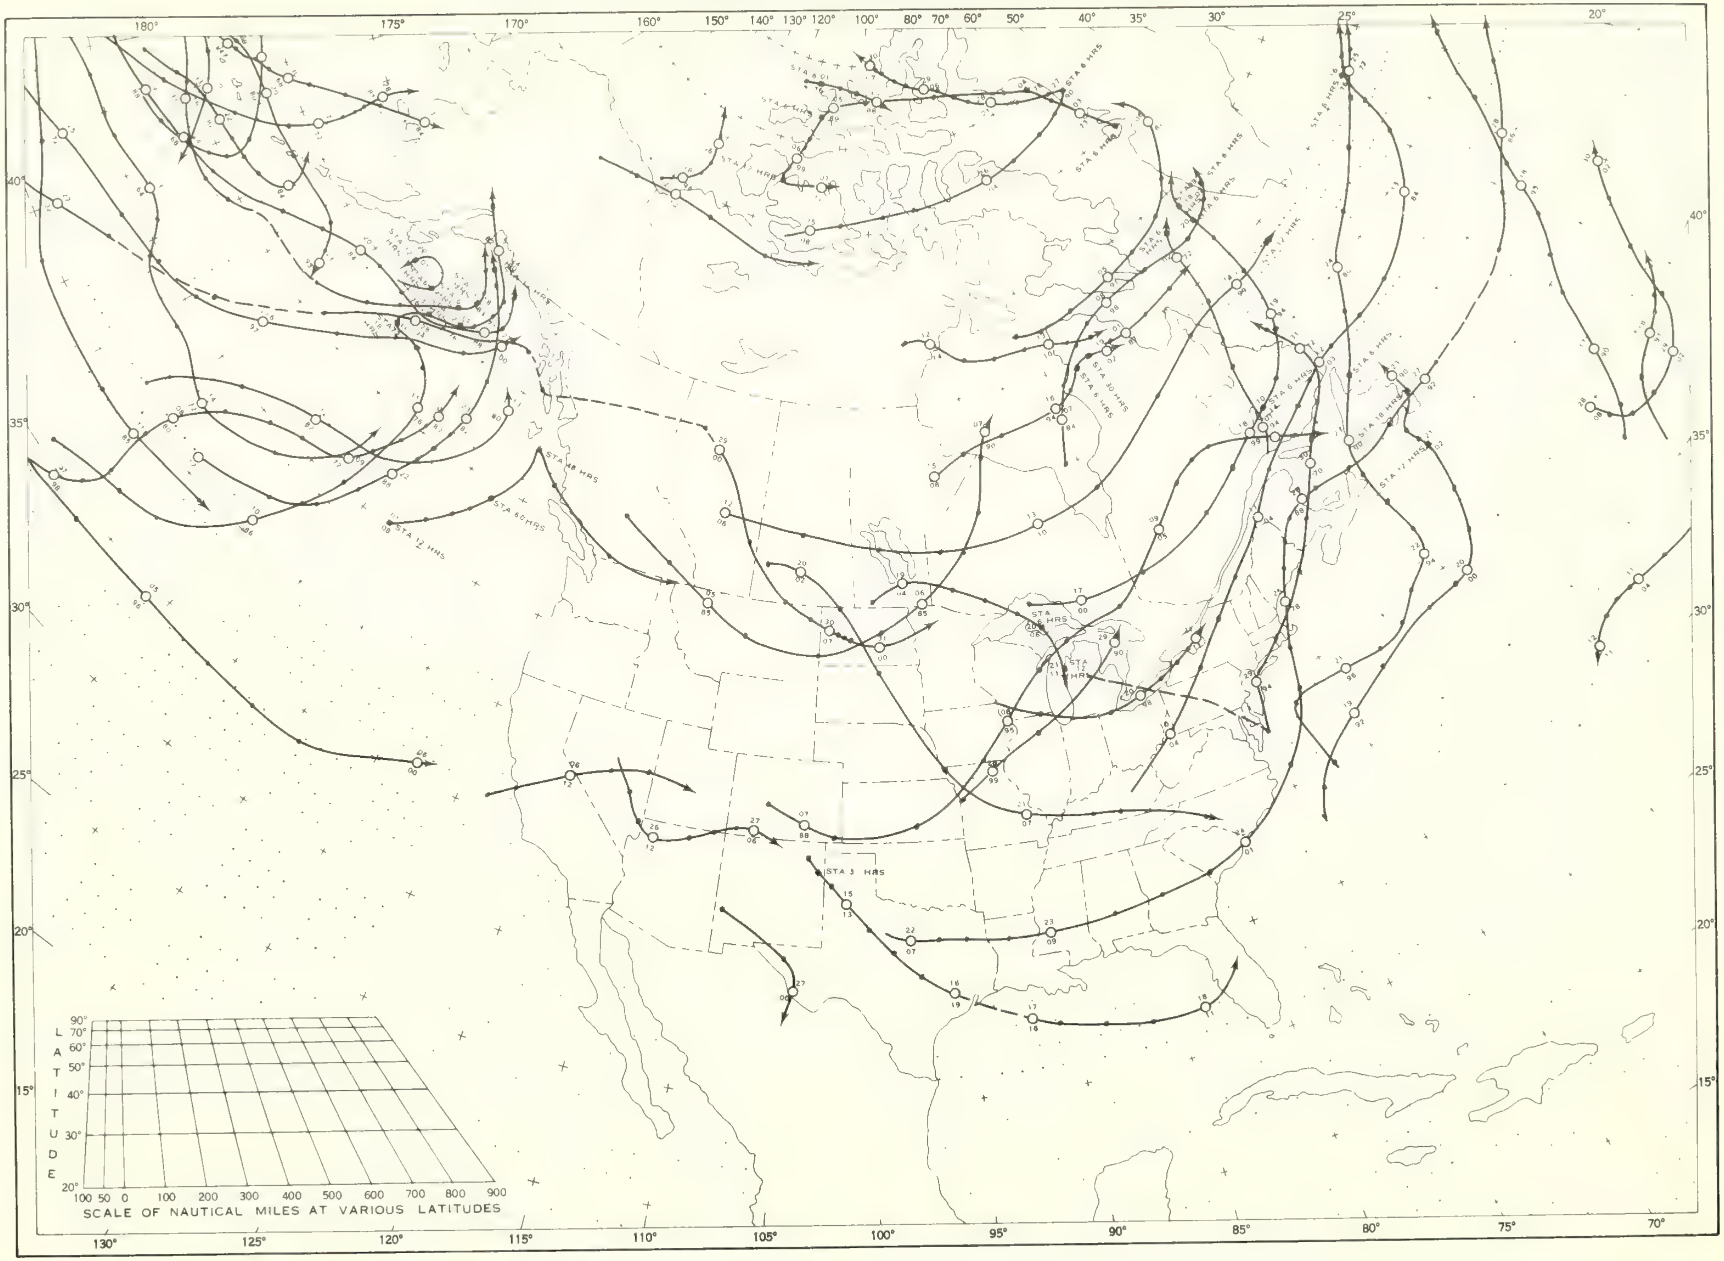
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, December 1966.



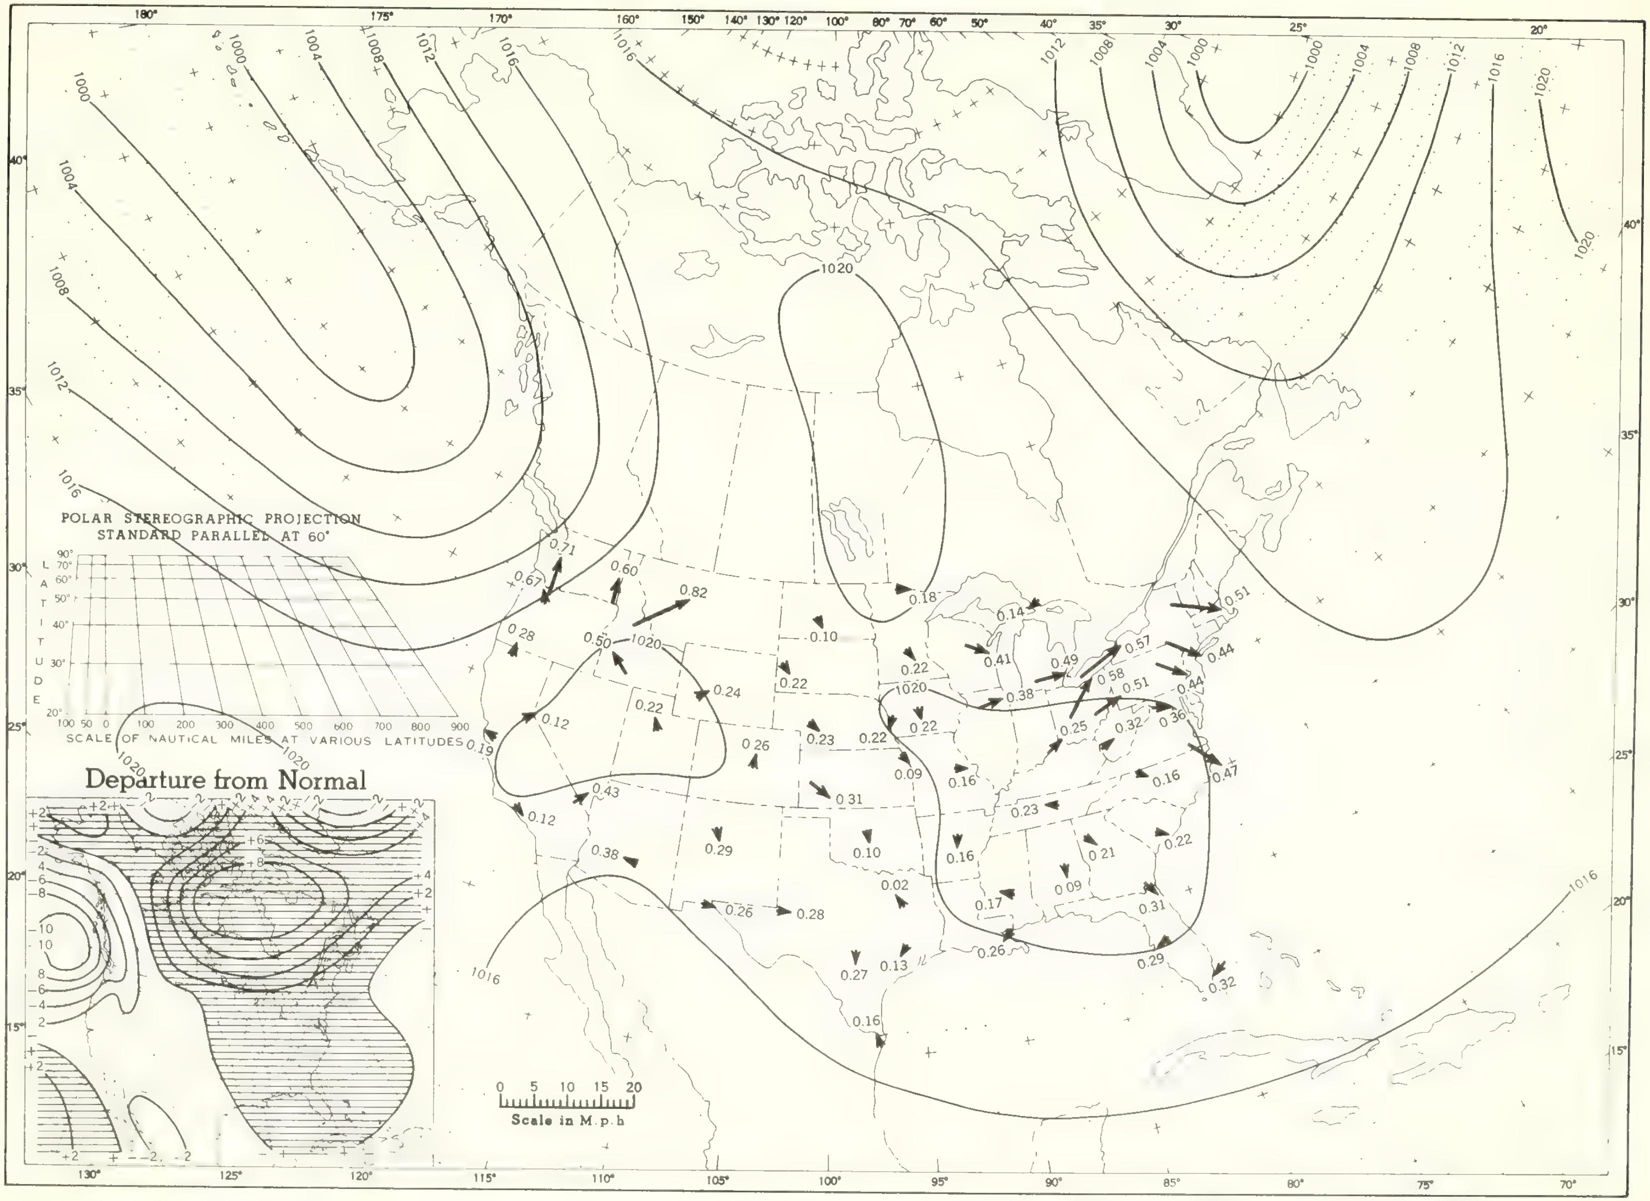
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, December 1966.



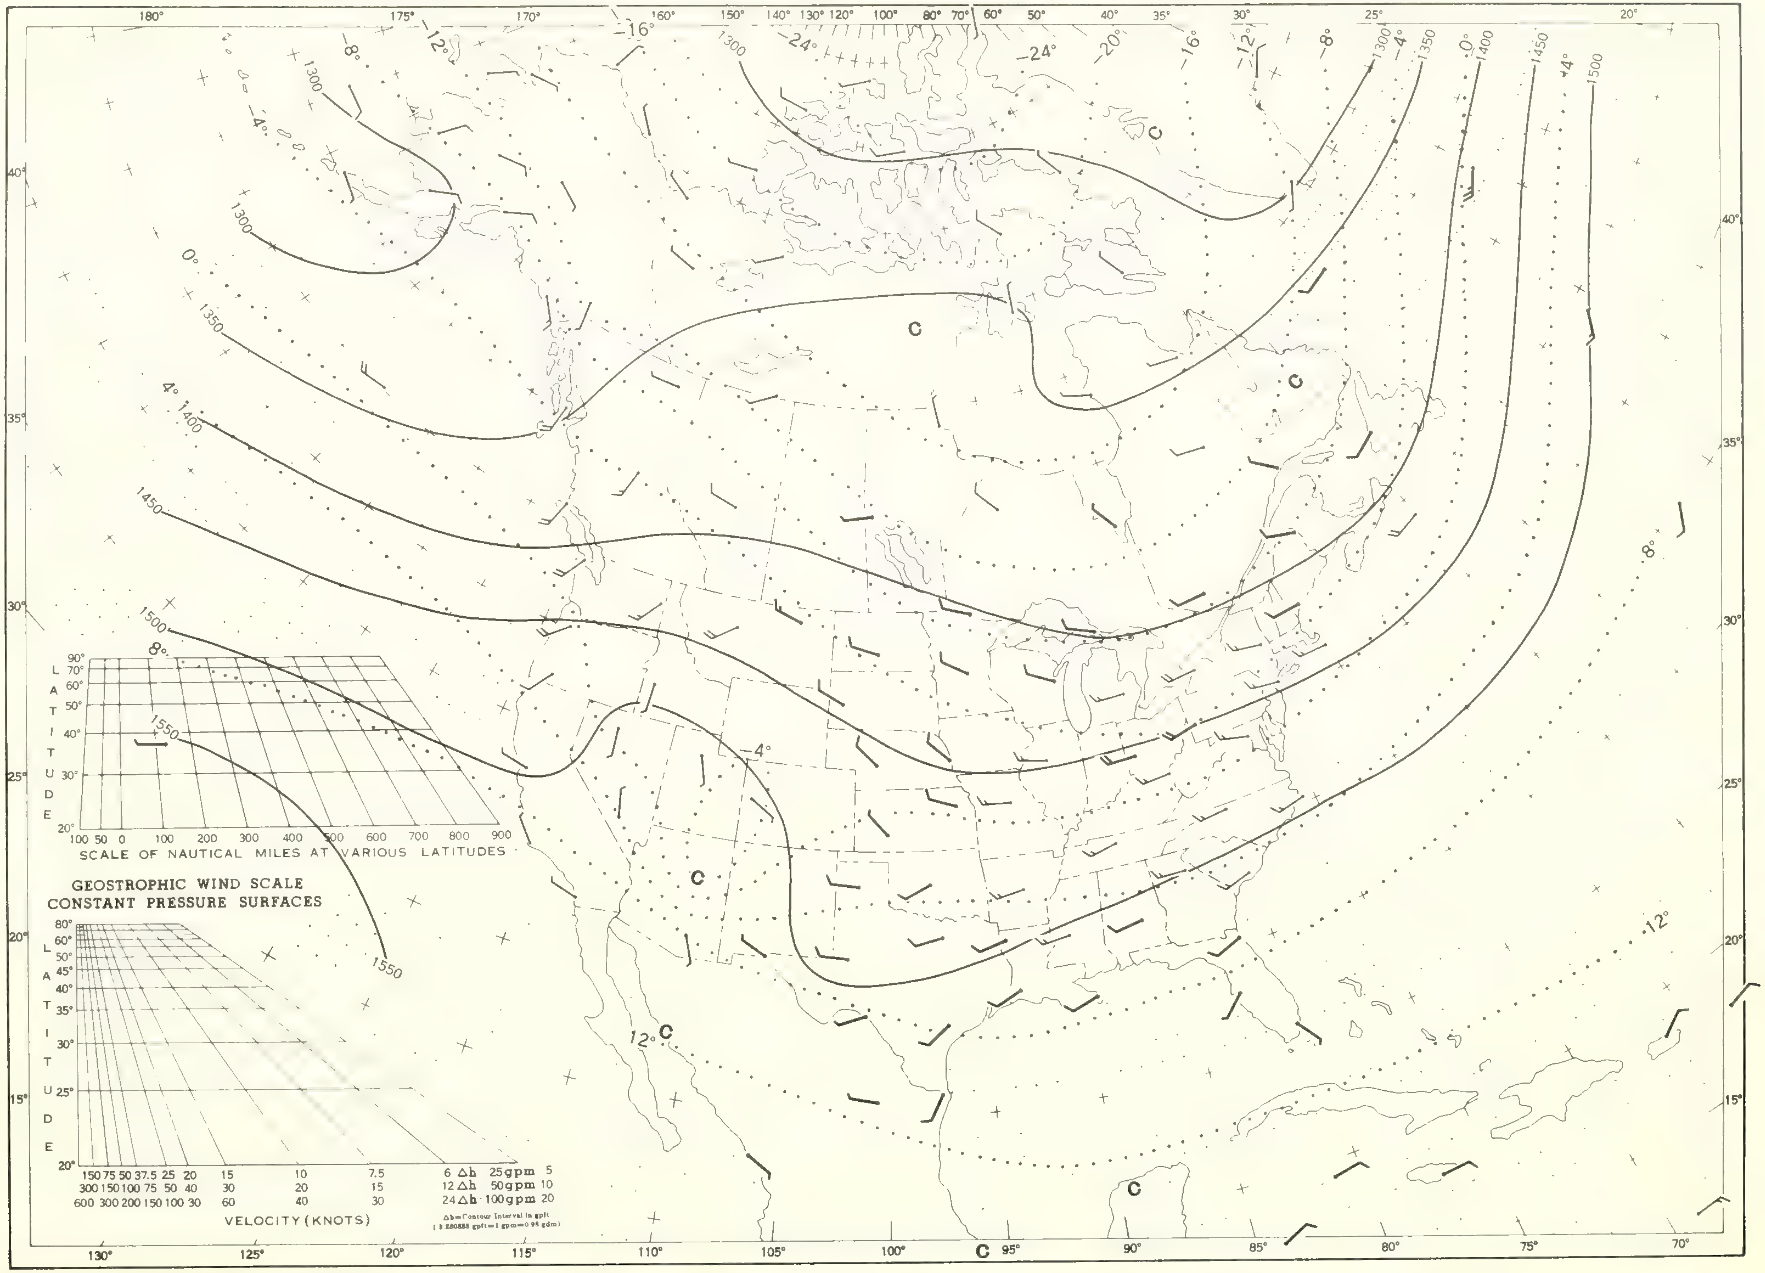
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, December 1966. Inset: Departure of Average Pressure (mb) from Normal, December 1966.



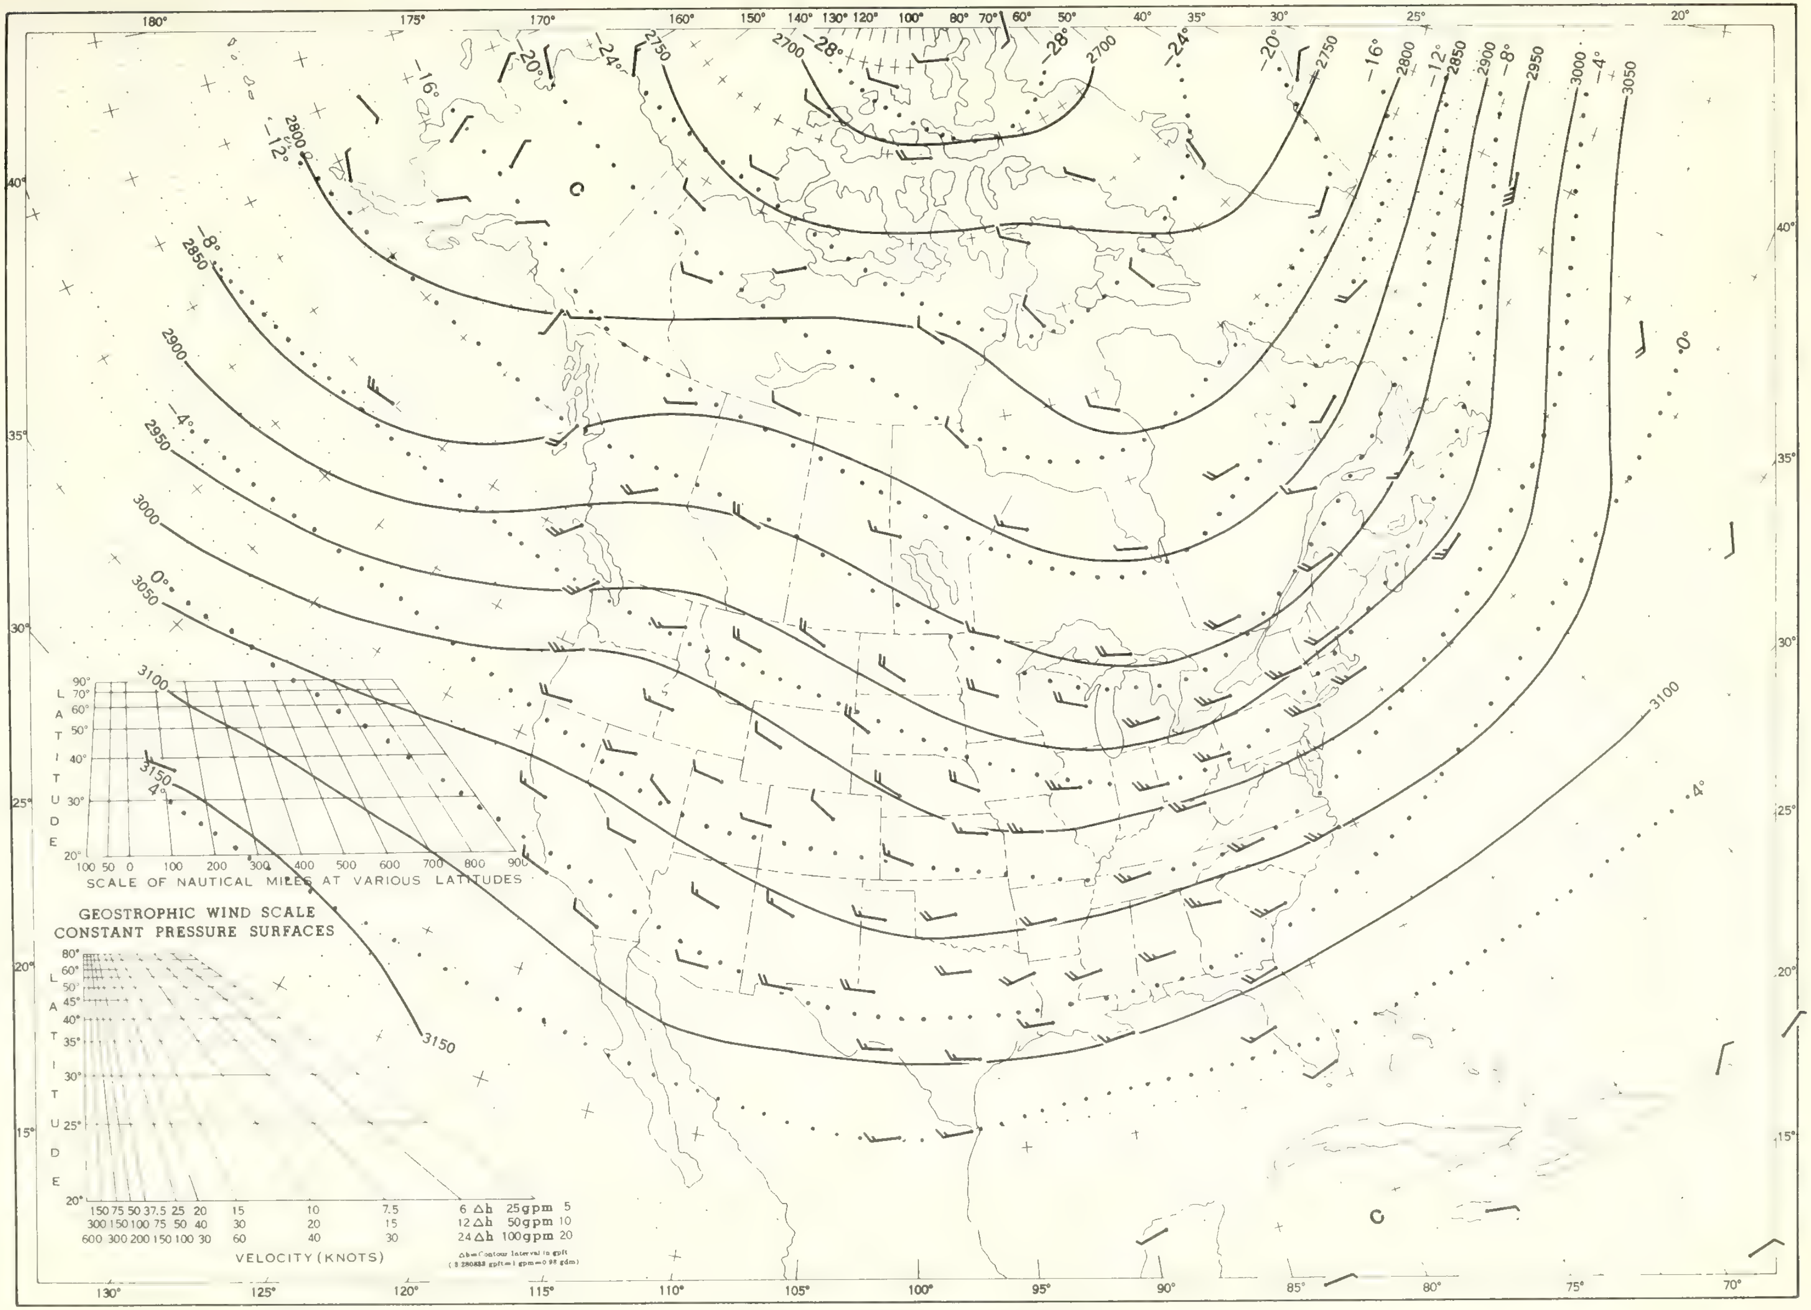
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, December 1966. Average Height and Temperature, and Resultant Winds.



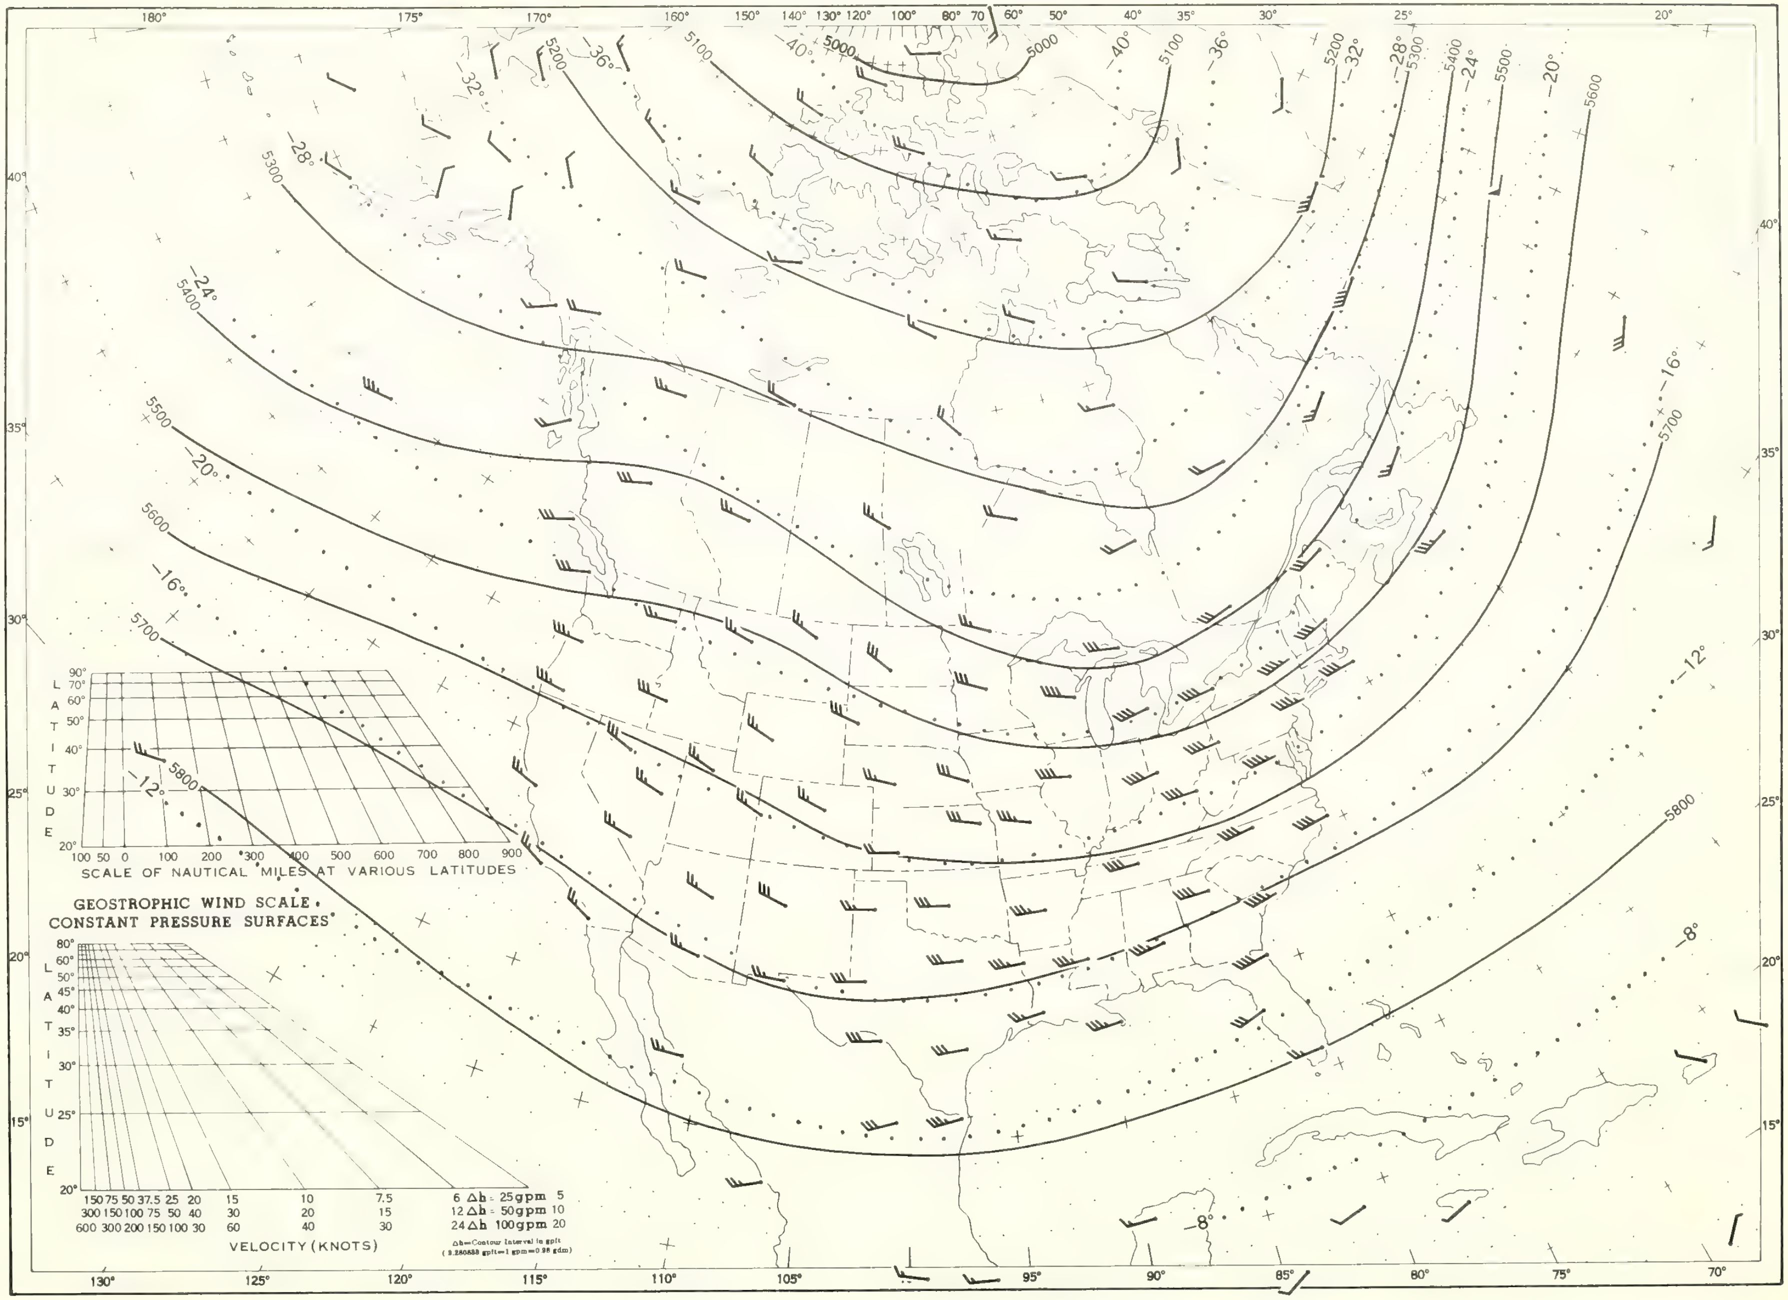
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, December 1966. Average Height and Temperature, and Resultant Winds.



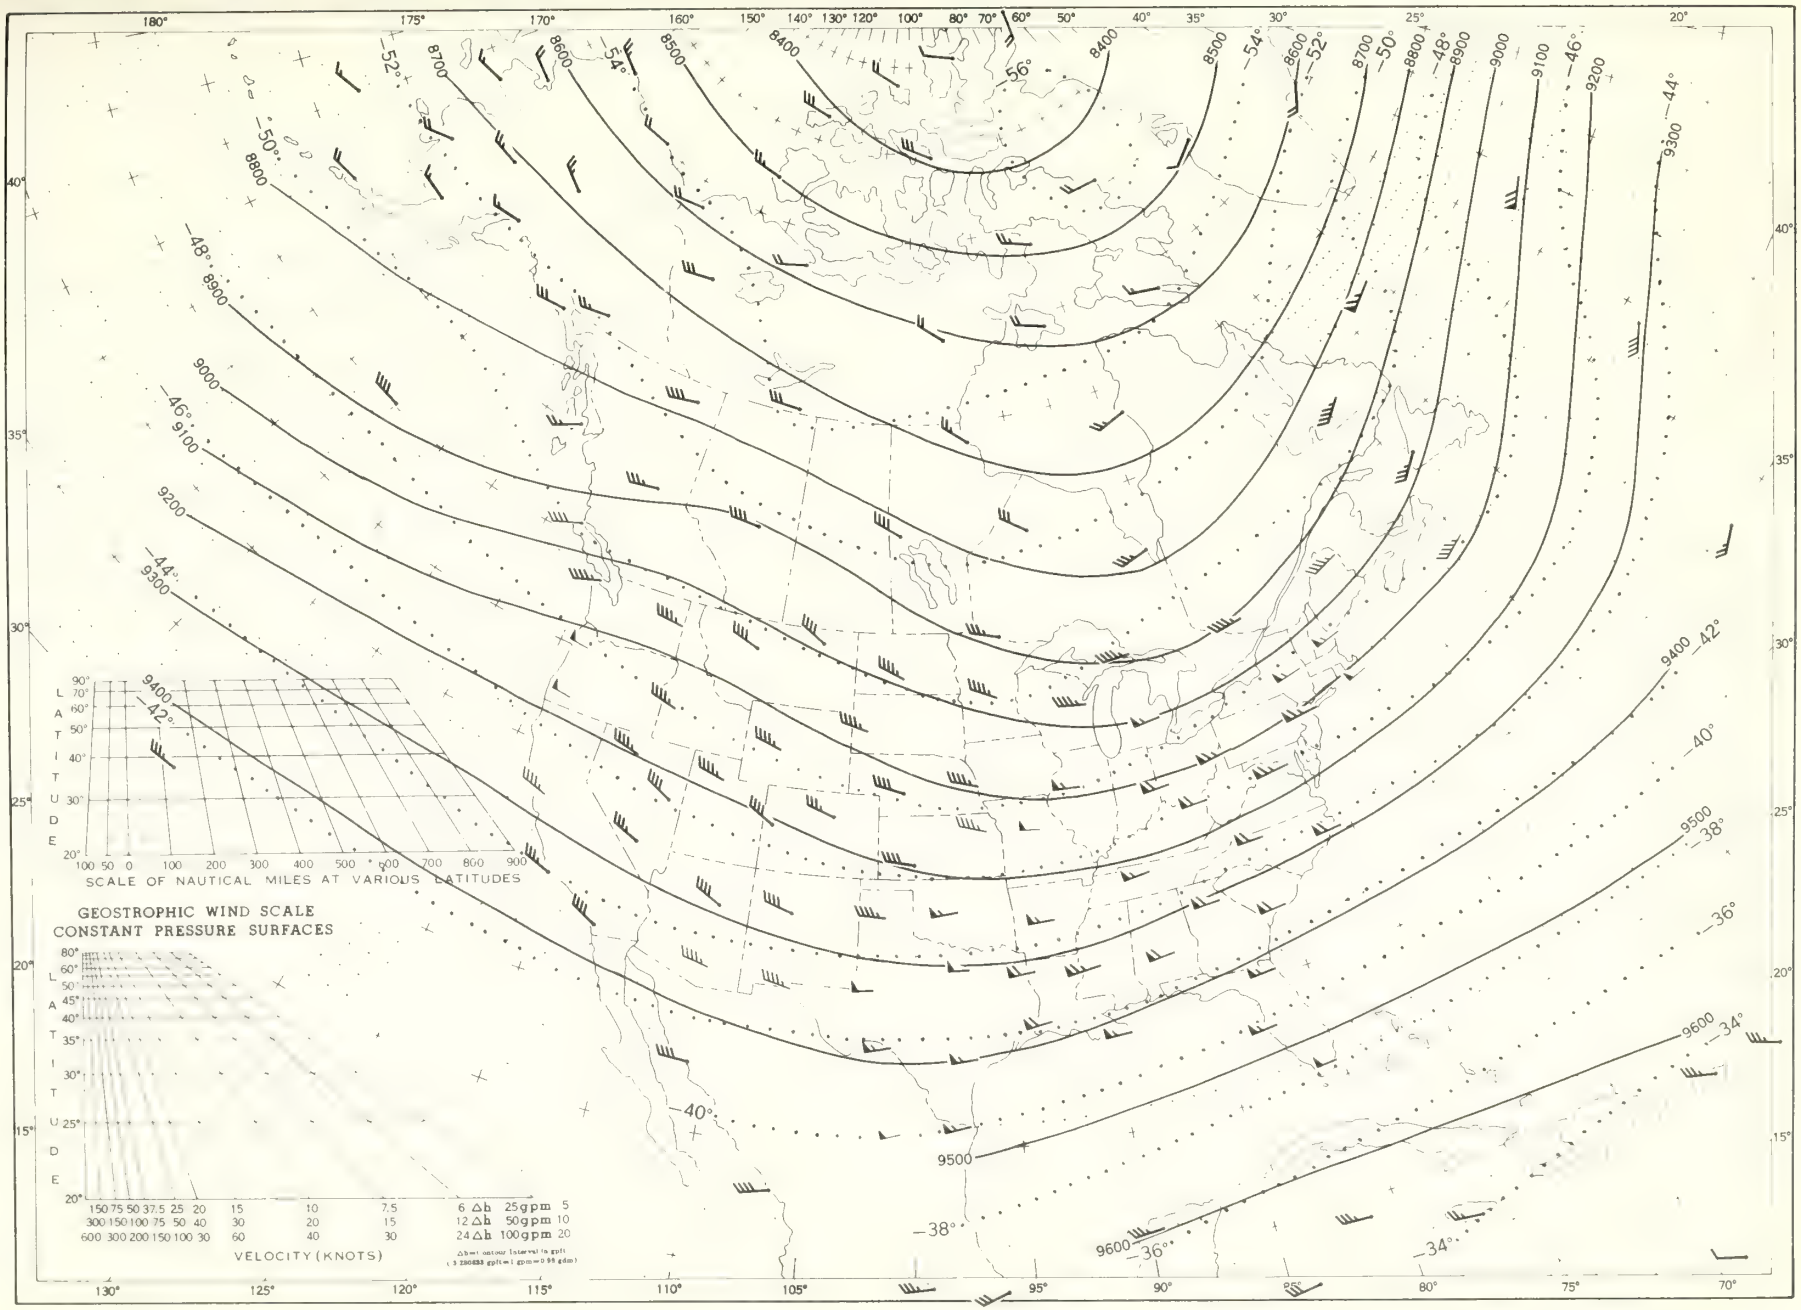
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, December 1966. Average Height and Temperature, and Resultant Winds.



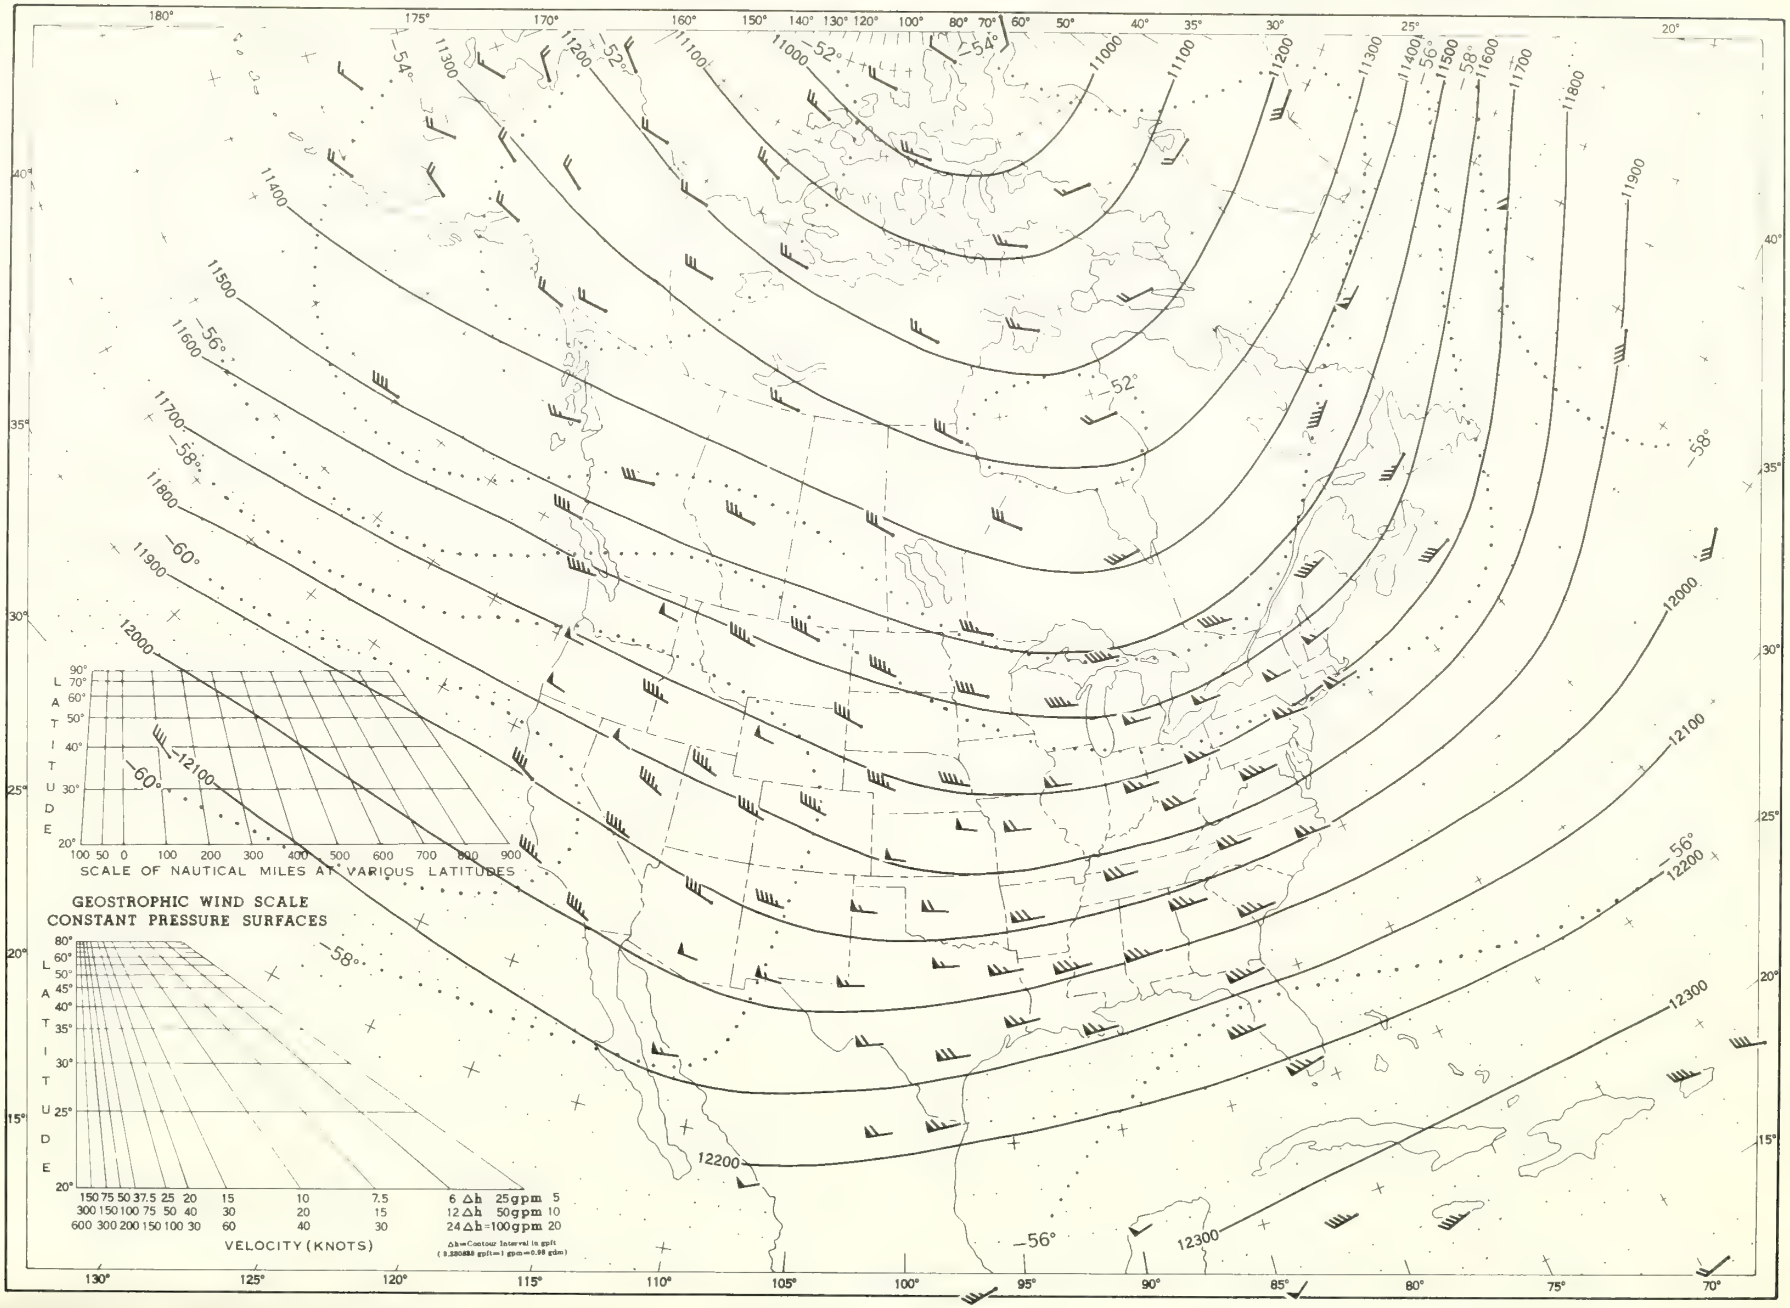
See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, December 1966. Average Height and Temperature, and Resultant Winds.



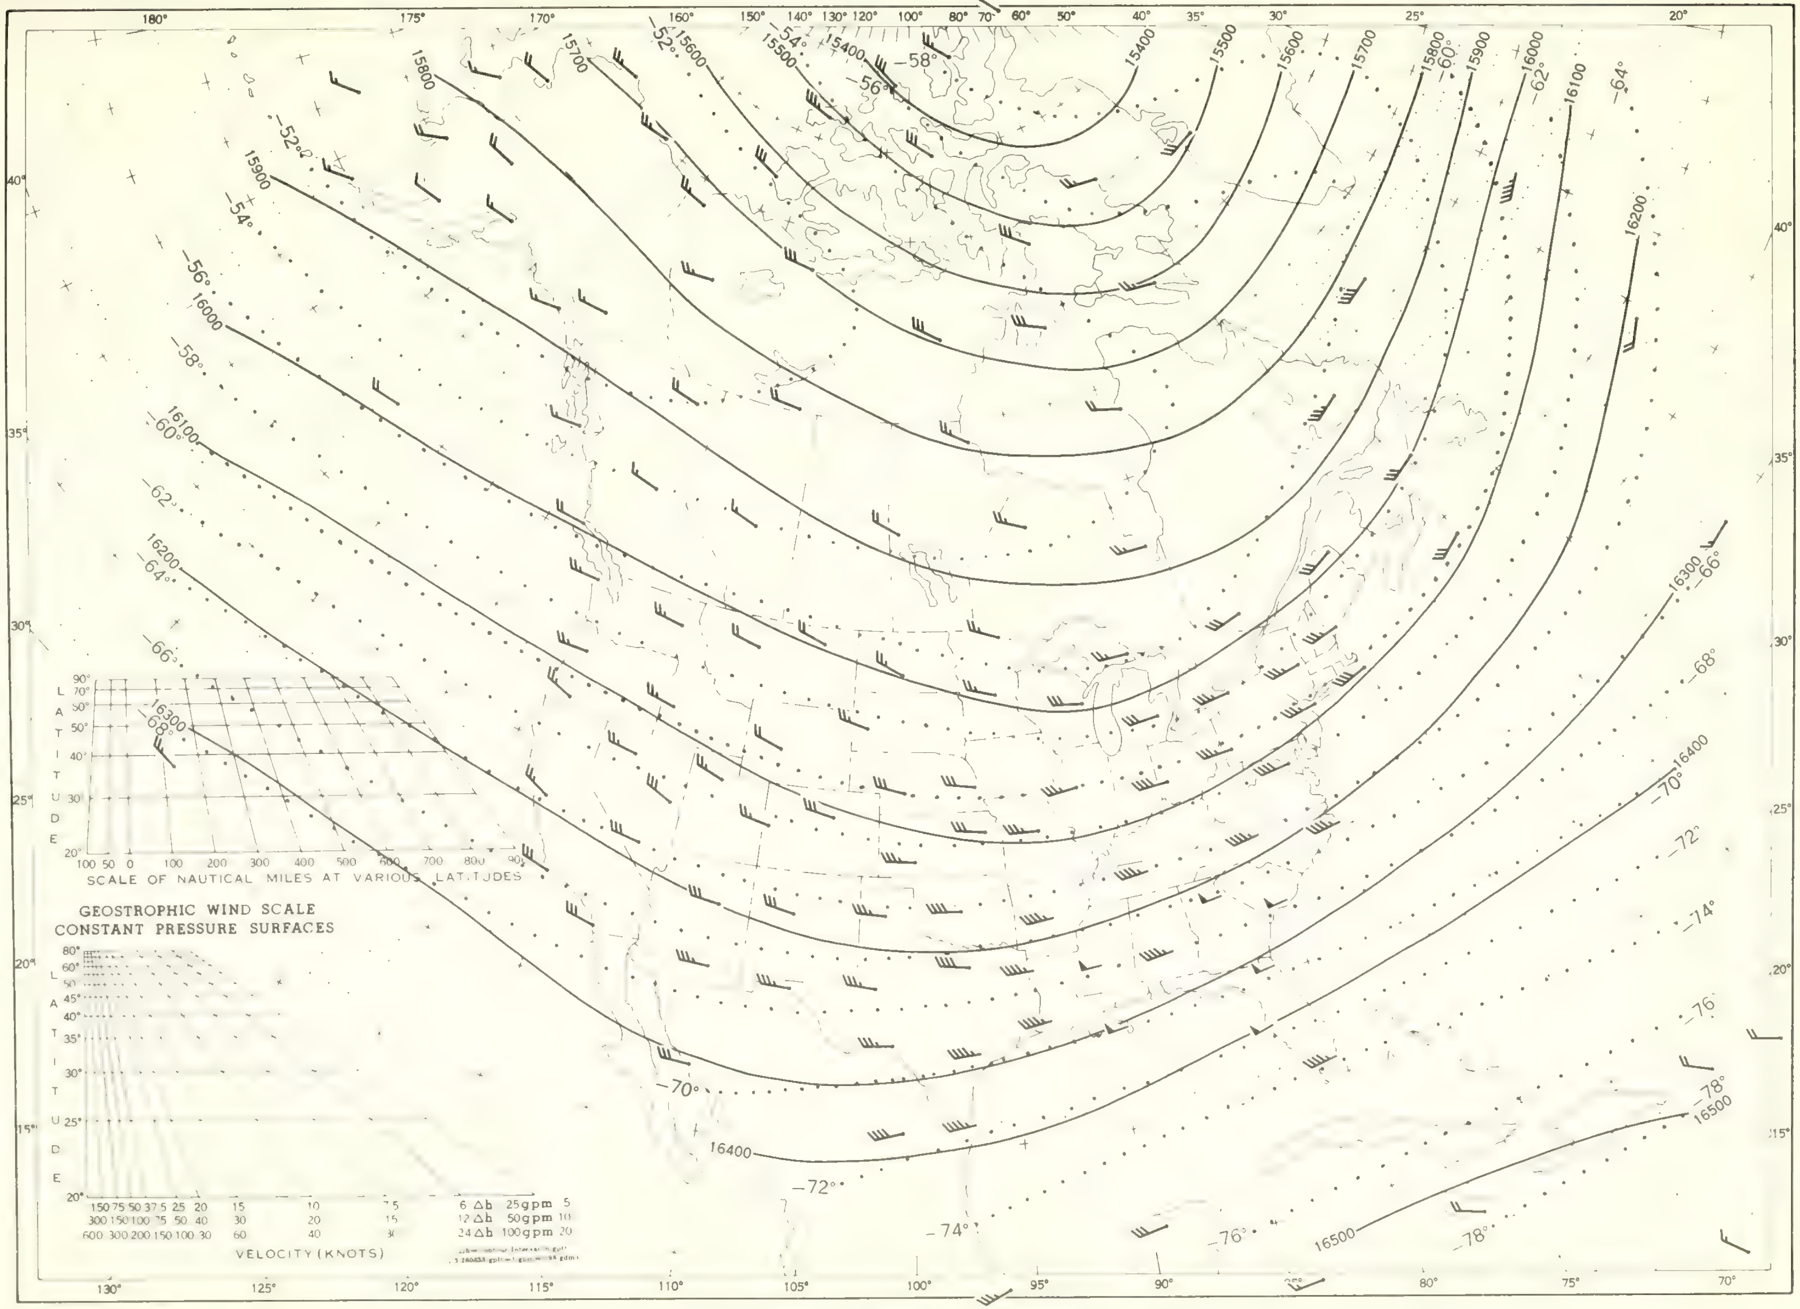
See Chart XI for explanation of map.

Chart XV. 200-mb. Surface, 1200 GMT, December 1966. Average Height and Temperature, and Resultant Winds.



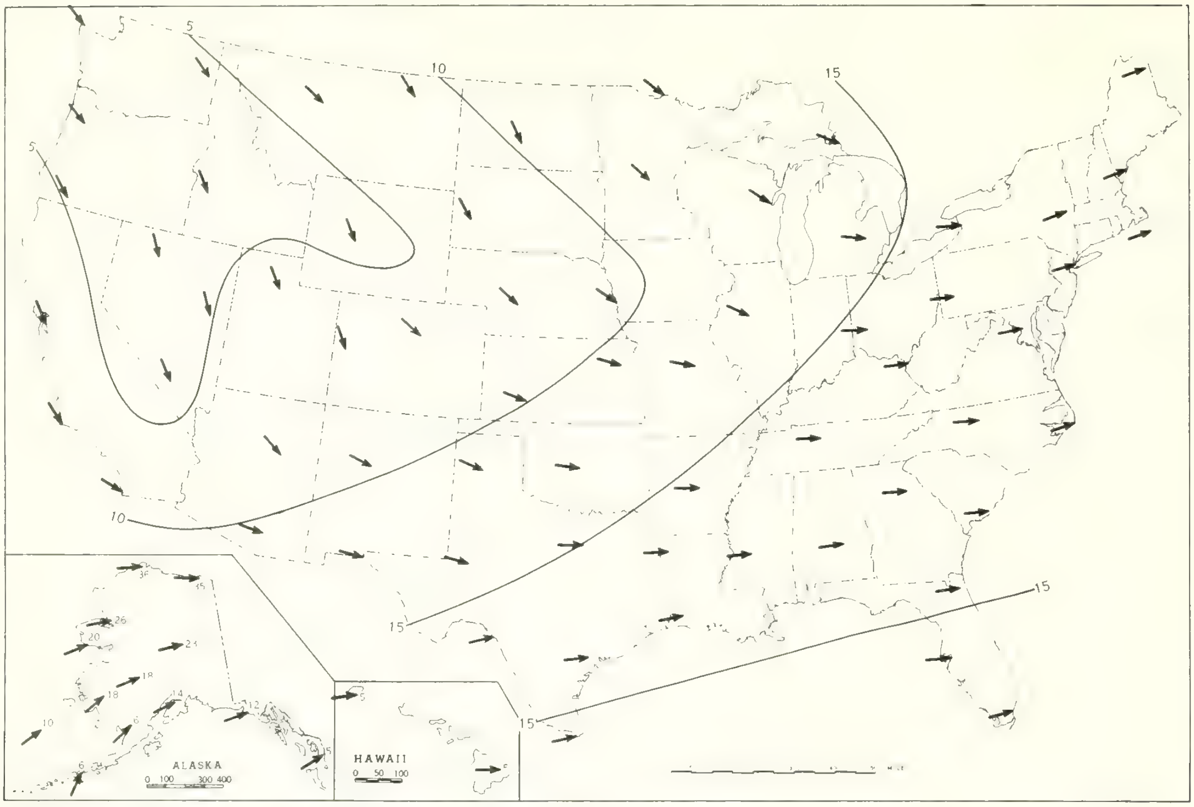
See Chart XI for explanation of map.

Chart XVI. 100-mb. Surface, 1200 GMT, December 1966. Average Height and Temperature, and Resultant Winds.

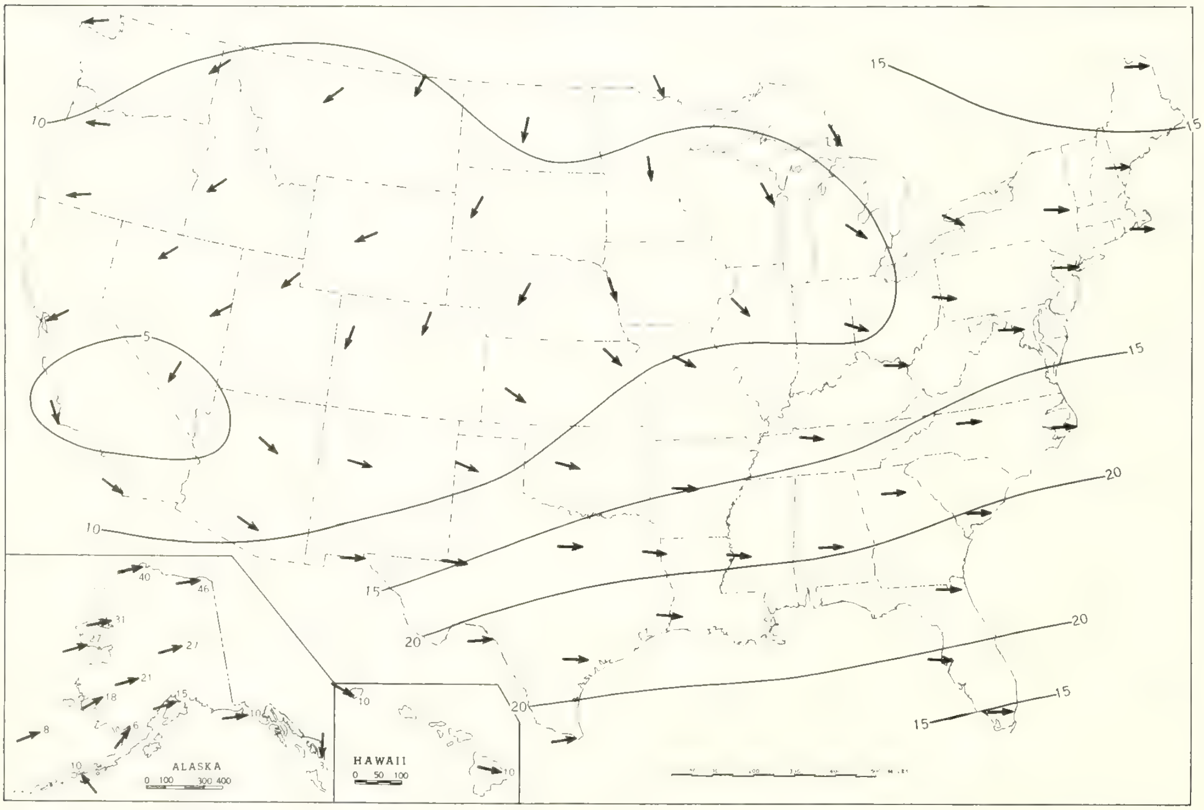


See Chart XI for explanation of map.

Chart XVII. A. 50-mb. Surface, 1200 GMT, **December 1966**. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, **December 1966**. Resultant Winds.



Wind speed (isotachs) in knots. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 13 ANNUAL 1966

GENERAL SUMMARY OF WEATHER CONDITIONS

L. H. Seamon
Environmental Data Service, ESSA
Washington, D. C.

HIGHLIGHTS:

1. Heavy snowfall in East.
2. Spring flood in Red River of North Valley.
3. The great blizzard in the northern Great Plains.
4. The May freeze.
5. Four major tornadoes.
6. Two hurricanes.
7. Weather favored bumper crops most areas.

TEMPERATURE.--Temperatures for 1966 averaged below normal east of the Continental Divide. The year was coldest, relative to normal, in the Red River Basin of the North and in a southeastern area including much of the Virginias, the Carolinas, Tennessee, Kentucky, Georgia, Alabama, and Mississippi. In these areas the year was 2° or more colder than normal and monthly averages were all below normal except March, July, and November. Degree Days east of the Rockies were above normal indicating heavier than usual fuel consumption. The year was warmer than normal in the Far West. Temperatures for each of the four seasons averaged near normal. Extreme temperatures in the 48 States ranged from -52° near Baudette, Minn., on February 19 to 121° at Death Valley, Calif., on August 5, 6, and 7.

The year's temperature highlights are as follows: January was among the 10 coldest on record in the Midcontinent and Southeast where extreme cold prevailed during the last 2 weeks of the month and continued through the first week of February. Subzero minima reached all states except Florida and Louisiana and only the southern tips of Florida and Texas in the Gulf region escaped freezing. On January 28 the temperature dropped to -50° near Baudette, Minn., and did not rise above -26° at International Falls, Minn. On January 30, Russellville, Ala., reported -24°, the lowest temperature ever recorded in Alabama, and on the same morning 1/2 inch of ice was reported in Corpus Christi, Tex.

March was unusually warm in the 48 States, but among the coldest on record in Alaska.

On April 4-5 a freeze caused extensive damage to fruit in the Grand Junction area of Colorado, and another freeze on the 19th and 20th caused statewide damage. Fruit was in an advanced stage due to a warm March.

An unusually late spring freeze May 9-11, with record-breaking low temperatures for May, damaged fruit and vegetables from North Carolina and Tennessee northward, with heaviest losses in Ohio and Michigan.

During a brief cold snap at the beginning of June, record low temperatures for June were recorded for scattered stations south of the Great Lakes and frost occurred in the Appalachians as far south as North Carolina.

Temperatures rose to 100° or higher from the Dakotas and Wyoming eastward over the Mississippi and Ohio Valleys to the middle Atlantic coast the last part of June. The heat wave became widespread the first half of July. In the Northeast temperatures reached 100° or higher on 5 days at many stations. Harrisburg, Pa., and New York, N. Y., reported 107° on July 3, alltime records. In July temperatures reached 100° or higher on 24 days at Wichita Falls, Tex., and on 6 days at Huron, S. Dak. The heat wave was blamed for about 70 deaths in the St. Louis area where the maximum was over 100° each of the 6 days, July 9-14. The heat contributed to hundreds of other deaths elsewhere east of the Rockies.

In mid-September, record low temperatures for so early in the season occurred at many stations from the Great Lakes to New England. Another early freeze for so far south extended to central Florida and almost to the tip of southern Texas the beginning of November with 28° on the 3d at New Orleans for the lowest in November since 1871.

Santa Ana winds caused record high November temperatures in southern California on November 1, with 101° at Los Angeles (82-year record) and 97° at San Diego (95-year record).

On December 12 to 14 freezing temperatures extended to the extreme southern tip of Texas, along the Gulf coast and to central Florida. Temperatures as low as the middle 20's in the McAllen-Weslaco-Harlington area and 30° at Brownsville caused moderate to locally severe damage to most vegetables in southern Texas.

PRECIPITATION.--Above normal precipitation in the 48 States for 1966 was limited to four main sections. These were (1) the Dakotas, eastern Montana and northern Minnesota (2) from central and southern Arizona eastward to Florida and Georgia except central Texas (3) from the lower Appalachian region northward through the central Ohio Valley (4) and a belt extending from Detroit, Mich., and Toledo, Ohio, westward into Iowa. Some of the year's heaviest precipitation, relative to normal, fell in the South. Miami, Fla., recorded 82.06 inches or 137 percent of normal and Port Arthur, Tex., 70.67 inches, 133 percent of normal.

The warm season precipitation (April-September) was near normal in most areas east of the Rockies and below in much of the Far West. In fact, the warm season precipitation pattern was much like that for the year, with above normal amounts limited mostly to the South and northern Great Plains. It was extremely dry in a relatively small area of western Maryland and adjacent portions of Virginia, West Virginia, and Pennsylvania. Driest area in the Far West at the end of September extended from southwestern Idaho through Nevada and California where many sections reported less than 25 percent of normal precipitation since January 1, 1966.

FLOODS.--Severe flooding occurred in the Red River of the North Valley in March and flooding continued into April. Total damage was estimated at nearly $8 million.

In April severe flash flooding occurred in northeastern Texas. The American Red Cross reported 27 deaths due to drowning.

During August, record to near record flooding in east-central Nebraska caused damage, based on early estimates, of over $2.2 million. (See special flood articles in this publication)

DROUGHTS.--At the beginning of the year record to near record low reservoir and ground water supplies prevailed from northern West Virginia and northern and eastern Virginia to southeastern New York and central New England. Moderate precipitation during January and February only temporarily eased this Northeast Drought. Precipitation was much below normal during spring and summer and the drought intensified. By the end of August this meteorological drought was rated as extreme by the Palmer Index in northeastern West Virginia, northern and central Virginia, middle and northwestern Maryland, northern Delaware, south-central and eastern Pennsylvania, New Jersey, southeastern New York, and southern New England. The Potomac River was at its lowest level in history. The area of severe drought gradually diminished with generous rains in September and October and by the end of the latter month was limited to a small area in south-central Pennsylvania.

Moderate to severe drought developed in east-central Indiana and parts of Ohio in July and moderate drought continued into September. A severe drought prevailed in the Nevada area until November. Deficient precipitation in the middle and southern Great Plains after September was detrimental to small grains.

In Hawaii a period of unusually dry weather began over most of the Island in March and heavy irrigation was widespread by month's end. The dry weather continued through June. Since the dry spell was preceded by several months of cool wet winter weather, the drought was not felt much until May even though April was the driest on record at many stations with records dating back 50 years or more. By the end of May, the third month of dry weather, pastures and fruits needed rain, irrigation was heavy, and brush fires on Oahu were described as the worst in 15 years. Rains brought relief to parts of the State in July, and Hilo reported its worst flood in history on the 25th when up to 17 inches of rain fell in that area during a thunderstorm; damage was $250,000. Not until November did widespread above normal precipitation occur.

SNOWFALL.--For the year 1966 snowfall was above average in the northern Great Plains, in eastern areas from Tennessee and the Carolinas northward, and from Arkansas and Oklahoma southwestward through Texas. Annual amounts were below average from the Rocky mountains westward, and in Kansas, Missouri, Illinois, Wisconsin, and eastern Nebraska.

Snowfall for the first four months of 1966 was heavy from northern Texas eastward and northeastward, but was below normal in most of the Far West. Heavy January falls east of the Rockies occurred January 8, 23-24, and 28-31, the last week of February, and March 2-4.

SEVERE STORMS.--Although neither as numerous nor as destructive as in 1965, tornadoes in 1966 nevertheless took a heavy toll of life and property. In 1966, these storms, totaling 570, were responsible for at least 105 deaths, hundreds of injuries, and property losses totaling many millions of dollars. Four of the year's tornadoes were outstanding. The first of these storms on March 3 killed 58 persons, injured over 500, and caused about $18 million property damage in Mississippi, with most of the destruction in the city of Jackson, the State's Capital. The second, traveling at 60 m.p.h., crossed Florida from Tampa Bay to Merritt's Island on April 4, leaving in its path 11 persons killed, over 400 injured, and property losses in the millions of dollars. One of the most destructive tornadoes on record, property-wise, swept through Topeka, Kans., on June 8, killing 16 persons, injuring 406 and causing over $100 million property losses. The fourth outstanding tornado of the month, occurring on October 10, destroyed Belmond, Iowa, with a loss of 6 lives, 172 injuries, and property losses estimated from $7.5 to $11 million.

Two hurricanes occurred. Alma moved inland just 20 miles east of Apalachicola, Fla., on June 9, the earliest hurricane of record to cross the U. S. Coastline. Alma was blamed for 6 deaths in Florida. Scattered damage, mostly in Florida, totaled about $10 million. Hurricane Inez on October 4, crossed extreme southern Florida with wind speeds up to 130 m.p.h. The hurricane was blamed for 3 deaths, 11 injuries, and property losses estimated at about $5 million in Florida.

WINTER TYPE STORMS.--A coastal storm January 23-24 brought snowfall ranging from 1/2 to 1 1/2 feet in Maryland to over 2 feet in much of New York and New England. Only 2 to 3 days later another coastal storm covered northern Georgia with 4 inches of snow and ice, produced the most damaging ice storm in 50 years in coastal areas of the Carolinas, and left 1/2 to over 1 foot of snow from Virginia to eastern Canada. This stormy situation was climaxed in the closing days of January by the worst blizzard in the east since February 1958. From the lower Appalachians and Virginia to New York and New England, snowfall was 1 to 3 feet, winds 30 to over 60 m.p.h., snow drifts to over 20 feet, and low temperatures from the midteens to subzero. Transportation was at a standstill, marooning thousands of persons and closing schools for several days to over a week. Most Federal offices and business were closed at least 1 day. There were over 50 deaths.

One of the most severe blizzards of record swept across the northern Great Plains into Minnesota on March 2-5. It continued unabated for 4 days in some areas. Snowfall was 1 to 3 feet, winds averaged 30 to 50 m.p.h. several days with gusts to over 100 m.p.h., snowfall drifted to over 30 feet, visibility was reduced to zero the 3d and 4th, and temperatures dropped to 10°. At least 15 persons died, traffic was paralyzed, and over 100,000 head of livestock were lost. Another severe March storm moved northeastward from Kansas and Nebraska to Minnesota and Upper Michigan on the 22d to 24th, with blizzard to near blizzard conditions. The rain, glaze, sleet, hail, and snow with high winds caused heavy damage in the central Great Plains.

Record-breaking snowstorms for so early in the season occurred in the central Rockies and north-central areas about mid-October and in the lower Ohio Valley and northern portions of the Gulf States November 2-3. A snowfall of 13 inches in 24 hours set a new November record at Louisville, Ky. On December 23 to 25, heavy snowfall of 1/2 to 2 feet fell from the Arkansas-Tennessee-North Carolina area to eastern Canada, disrupting Christmas holiday traffic.

CROP PRODUCTION IN 1966 EXCEEDED ONLY BY LAST YEAR.--The crop reporting Board of the U.S.D.A. reported that crop production in 1966 tied 1963 as the second highest of record, despite some damage from subfreezing temperatures, lack of moisture at times, and unusually high early summer temperatures. Several major fall maturing crops registered record or near record yeilds per acre as shower activity picked up early in August and temperatures turned cooler. Most northern States enjoyed long growing seasons as freezing temperatures held off until late crops matured. West of the Mississippi, harvesting conditions were generally favorable except parts of Kansas and Nebraska, but in portions of the eastern Corn Belt, the South Atlantic and eastern South Central States conditions were less favorable.

EXCESSIVE PRECIPITATION

(Excessive Short Duration Rainfall)

YEAR 1966

This table contains statistics of maximum amounts of rainfall during the calendar year 1966. Data presented in this table are generally from stations equipped with recording gages. Stations are at Airport locations unless otherwise shown.

Excessive precipitation data for the years 1896-1935 inclusive, generally present the accumulated amounts of precipitation for each 5, 10, or 20 minute intervals during storms in which the rate of fall equaled or exceeded .25 inch in any 5 minute period, or .30 in any 10 minute period, or .35 in any 15 minute period, etc., the tabulation beginning with the 5 minute period where the rate of .05 inch in 5 minutes began and continuing by 10 or 20 minute intervals up to 120 minutes. A detailed explanation of the method used may be found in the publications listed in the last paragraph of this explanation.

The present method, adopted with data for the calendar year 1936, gives the maximum fall of precipitation for the periods 5 to 180 minutes, the maximum amounts being taken for the periods in which the fall is greatest for the given time, and is tabulated to show maximum amounts for 5, 10, 15, 20, 30, 45, 60, 80, 100, 120, 150 and 180 minutes, even if the fall does not equal the excessive rate for some of the periods. (The 15 minute amount was not computed for 1936-43 and the 150 minute amount was not computed for 1944 through 1948).

The following Table A shows limits at which precipitation was considered excessive in this publication:

TABLE A

Duration (minutes)	Depth of precipitation (inches)	Duration (minutes)	Depth of precipitation (inches)
5	.25	60	.80
10	.30	80	1.00
15	.35	100	1.20
20	.40	120	1.40
30	.50	150	1.70
45	.65	180	2.00

This table is made up from the formula, $A = t + 20$ where A is the accumulated depth in hundredths of inches and t is the time in minutes.

For the years 1936 through 1948 stations in North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee, Arkansas, Louisiana, Texas, Oklahoma, and San Juan, P. R. used the limits shown in the following Table B:

TABLE B

Duration (minutes)	Depth of precipitation (inches)	Duration (minutes)	Depth of precipitation (inches)
5	.40	60	1.50
10	.50	80	1.90
15	.60	100	2.30
20	.70	120	2.70
30	.90	150	3.30
45	1.20	180	3.90

This table is made up from the formula $A = 2t + 30$. Its use, however, was discontinued at the end of 1948 and Table A is used by all sections for 1949 and the following years.

Publication of Data. A summary of maximum precipitation data for the years prior to 1896 is published in the annual report of the Chief of the Weather Bureau for 1895-1896. Excessive precipitation data for the period 1881-1896 are published in the annual report of the Chief of the Weather Bureau 1896-1897. Data for the years 1897 through 1934 have been published in the appropriate annual reports of the Chief of the Weather Bureau. For the years 1935 through 1949 these data are published in the appropriate issue of the United States Meteorological Yearbook. For 1950 and succeeding years excessive precipitation are presented in the annual issues of the Climatological Data, National Summary.

Data from airport unless otherwise specified.
U indicates Urban, R indicates Rural, sites.

* Maximum of record for this duration and station. Period of record is that compiled in Weather Bureau Technical Paper No. 2, revised, plus 1962 and 1963 data. New records are denoted only for 5, 10, 15, 30, 60, 120, and 180 minutes. The continuity of record at stations that have changed location is described on page 2 of the above reference.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

+ And also on an earlier date or dates.

B Number of days maximum 70°F. or above for Alaskan Stations.

Y Peak gust.

V Sun below horizon November 19 - January 23, inclusive.

X Sun below horizon November 24 - January 17, inclusive.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

Data in this table are obtained by conversion from data in the English Units table.

+ And also on an earlier date or dates.

B Number of days maximum 21.1°C. or above for Alaskan Stations.

Y Peak gust.

V Sun below horizon November 19 - January 23, inclusive.

X Sun below horizon November 24 - January 17, inclusive.

* less than 0.05

Data from airport or from airport and Urban site records combined.
U indicates Urban, R indicates Rural sites.
Data for this table are based on records through 1966 except as indicated in notes.
Date after station name indicates last year included in summarization of data.
Normal values are based on the period, 1931-1960, and are means adjusted to represent observations taken at the present standard location.
Degree days are based on a daily average of 65° F.
For detailed periods of record see ANNUAL LOCAL CLIMATOLOGICAL DATA, 1966.

Fastest mile is the speed of the wind recorded in the shortest time on an automatic recording wind instrument.
Clear Day averages 0-3 tenths sky cover, Partly Cloudy 4-7 tenths and Cloudy 8-10 tenths.
Heavy Fog includes data formerly referred to as "Dense" or "Thick." The upper visibility limit for heavy fog is 1/4 mile.
* Less than one-half.
- No record.
# Number of days Maximum 70° or above (Alaskan stations).
† Relative humidity means for period of record through 1960.
‡ Mt. Washington excluded.
ø Estimated amounts during typhoon.
1/ Means and extremes are from post office location through 1962.
2/ Based on records from Urban office through January 1943; airport through June 1964.

a Relative Humidity readings NOON Local Time.
b Relative Humidity readings reported 30 minutes later.
c Relative Humidity readings 8:00 a.m. and NOON Local Time.
d Estimated
e Reopened 1963.
f Combined Records, city office and airport.
g 8:00 a.m., and 2:00 p.m., EST.
n Estimated, recorder pen against stop at 128 m.p.h.
T Trace, an amount too small to measure.
x Sun below horizon continuously Nov. 19 - Jan. 23.
v Sun below horizon continuously Nov. 24 - Jan. 17.
(x and v)-Yearly totals for period sun above horizon.
m Record for 1949-1951, 1958-1962.
r Resumed 1965.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

These are the elevations of the barometer (in feet and meters above mean sea level) to which station pressure values pertain in the "Climatological Data" table in the monthly publication CLIMATOLOGICAL DATA NATIONAL SUMMARY.

GENERAL SUMMARY OF TORNADOES, 1966

Lucius W. Dye and Esther K. Grabill
Environmental Data Service, ESSA
Washington, D. C.

Tornadoes reported in the United States in 1966 totaled 570. More than half of the tornadoes, 314, occurred in May, June and July. Almost 3/4 (70%) occurred from April to July and 4/5 (79%) occurred from April to August. Tornadoes struck on 150 days during the year. Over half of these days (76) were in the 3-month period, June to August. Tornadoes occurred on 3 days out of 4 from April to August and 9 days out of 10 in June and July.

Fifteen tornadoes killed 105 persons in 10 states on 13 days. More than half of these people lost their lives in the Jackson, Miss., tornado which is described more completely below. Table 1 summarizes by State the occurrences of tornadoes and the deaths and injuries attributed to the storms. Four of the tornadoes crossed State boundaries. These are tabulated by state but are counted only once in the National total. The Jackson, Miss., tornado moved from Mississippi to Alabama on March 3. On July 9, a tornado crossed the Mississippi River from Dubuque, Iowa, to East Dubuque, Ill. A tornado traveled from south of Ashley, N. Dak., to nearby South Dakota on July 31. The fourth tornado to cross a State boundary struck near North Cannan, Conn., before moving to New Boston, Mass. Table 1 shows that the early-season tornadoes occurred in the Southland. Twenty-five of the 35 tornadoes that occurred in January to March struck 7 southern states: Alabama, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, and Texas. In contrast northern states were struck most frequently during the "middle months" May to July. This is shown in Table 2.

Table 3 shows the number of tornadoes, tornado days, and other information for each year, 1916 to 1966. The averages are for the 14-year period 1953 to 1966. In these recent years, tornado reporting has received more attention and the data are more nearly complete. There still remains the probability that some tornadoes are not reported and, therefore, are not listed in Storm Data from which this summary is prepared.

Table 4 lists and summarizes the tornadoes, tornado days, and deaths by months for the years 1953 to 1966.

Table 5 shows the number of tornadoes per 10,000 square miles in selected States in 1966. Table 6 lists the number of funnel clouds reported in each month for each State. Over 2/3 (71%) of the funnels were seen in May, June and July.

Several of the tornadoes are described briefly below because of the number of persons killed or injured or because of the extensive damage they caused.

Jackson, Miss.

One of the worst tornadoes in many years in Mississippi occurred in the late afternoon on Thursday, March 3. The tornado struck about 25 miles west-southwest of Jackson, moved through Jackson and continued its east-northeastward course for about 150 miles to the Mississippi-Alabama State line and about 50 miles into Alabama. The tornado dissipated about 50 miles west of Birmingham. The tornado flattened a shopping center in Jackson. Total damage in Mississippi was estimated at about $18 million; in Alabama less than $1/2 million. Deaths: 57 in Mississippi; 1 in Alabama. Injuries: 504 in Mississippi; 27 in Alabama.

Central Florida

Two tornadoes crossed central Florida the morning of April 4. One began near Clearwater, moved across Tampa Bay, through Carrollwood and Temple Terrace in Tampa, and continued to Gibsonia, Longham, Campbell City, and the Merritt Island area. The storm killed 11 persons and injured more than 400. The storm moved at about 60 m.p.h., which is faster than most tornadoes. Its path ranged from 200 to 500 yards wide and extended from the Gulf of Mexico to the Atlantic Ocean, a distance of about 140 miles. The tornado remained continuously in contact with the ground throughout its course. The damage due to the storm was estimated in the millions of dollars. The other tornado crossed the peninsula, beginning at Pinellas, moving across Tampa Bay, crossing the southern sections of Lakeland, and continuing to Breward County. It was not so destructive as the Tampa tornado described above and its path was intermittent, ranging from 100 to 200 yards in width while in contact with the ground.

Topeka, Kans.

One of the most damaging tornadoes of record ripped through Topeka, Kans., and vicinity on the evening of June 8. The first damage occurred 3 miles south of Dover, near the western edge of the Shawnee County line. The storm moved northeastward, reached the city limits of Topeka at 7:15 p.m., and continued through the heart of the city bringing complete destruction along a path 4 blocks wide and 8 miles long. The tornado destroyed 820 dwellings and caused major damage to 1010 and minor damage to 1925. All major structures at Washburn University were damaged and several were a total loss. Sixteen persons were killed and 406 were injured by the storm. Property damages were estimated to exceed $100 million.

Belmond, Iowa

About 1:55 p.m., October 10, a tornado struck in north-central Iowa. The storm destroyed 109 residences, caused major damage to 160 and minor damage to 308. It destroyed 75 business establishments and badly damaged 112. Six persons were killed and 172 were injured. Damages in the town were estimated at $7.5 million to $11 million. These estimates do not include the almost complete destruction of 27 farmsteads and hundreds of livestock killed and crippled. This was only one of a dozen tornadoes that struck Iowa vicinities on the afternoon of October 10. The others were less damaging. One at Ankeny caused property damage estimated at $300,000.

Figure 1 shows the average number of tornadoes and number of tornado days in each month based on the 14-year period, 1953 to 1966. The paths of the 1966 tornadoes are shown at the end of this article.

NORTH ATLANTIC TROPICAL CYCLONES, 1966

Richard M. De Angelis
Environmental Data Service, ESSA
Washington, D. C.

An active 1966 hurricane season bore a resemblance to the 1964 season. Eleven tropical cyclones developed in 1966 compared to twelve in 1964 (actually twelve storms were named this year but in post analysis it was decided that Kendra did not meet minimum requirements). Seven storms reached hurricane intensity, one more than in the '64 season. The '66 season lasted from June 4 through November 13 while the '64 season stretched from June 2 through November 9. The 1966 season produced five tropical cyclones before August. Since 1871 there have been only three other years when the fifth tropical cyclone developed as early as July. These were July 25, 1933 (21 tropical cyclones), July 27, 1936 (16 tropical cyclones) and July 22, 1959 (11 tropical cyclones). The season was active beyond the most recent 30-year average (1936-1965) of 9.5 tropical cyclones and 5.5 hurricanes.

Killer hurricanes Alma and Inez were the only tropical cyclones to affect the United States mainland, inflicting damage estimated at about $15.2 million. Damage from Inez was restricted to extreme southern Florida while Alma caused minor damage to the west coast of Florida and in Georgia. Fifty-four deaths, in the United States, resulted from the two hurricanes; 48 people lost their lives in Inez while 6 died in Alma. These storms also wreaked havoc outside the United States. Alma was responsible for 11 deaths and $200 million worth of damage in Cuba. Inez caused considerable loss of life and destruction throughout the West Indies and Mexico killing more than 900 people and inflicting damage estimated at more than $215 million.

Summaries of the individual tropical cyclones follow. Tracks shown in the chart and meteorological data are given in the accompanying tables.

HURRICANE ALMA, JUNE 4-14

Hurricane Alma, the first hurricane of the season and the earliest on record to cross a coastline of the United States, was spawned by a mid-latitudinal upper level trough which had fractured and drifted southward to a position over Nicaragua and Honduras on the 4th. The following day a reconnaissance plane found a tropical depression, with a central pressure of 1006 mb., (29.71 in.) over the Gulf of Honduras. This system had touched off torrential rains in Honduras and Nicaragua for several days and, late on the 5th, the town of San Rafael, Honduras reported 30 in. of rain; this resulted in 73 deaths as rivers flooded, engulfing the town in a sea of mud.

Plodding northward Alma intensified, rapidly reaching hurricane strength late on the 6th some 300 mi. south-southwest of Havana, Cuba. About this time, some 130 mi. from the storm's center, the 8,170-ton BLUE GRASS STATE reported a wind of 40 kt. and a pressure of 1009.1 mb. (29.80 in.). The hurricane continued to intensify as it drifted slowly northward. The 9,475-ton GULF TRADER, within 100 mi. of the storm's center and battling 20-ft. seas, reported a west-northwesterly wind of 47 m.p.h. and a pressure of 990 mb. (29.23 in.). Late on the 7th, Alma accelerated, reaching western Cuba the following day. The hurricane's 105 m.p.h. winds, torrential rains and resultant high tides destroyed over 47,000 acres of crops and more than 300 homes along the southern coast of Havana Province. The total estimated damage in Cuba was valued at $200 million. The institute of Meteorology in Havana reported maximum winds of 110 m.p.h. and a minimum pressure of 979.7 mb. (28.93 in.).

Accelerating northward at forward speeds up to 25 m.p.h. Alma moved into the Gulf of Mexico and along the west coast of Florida. On the afternoon of the 8th, as the storm passed 50 mi. west of Key West, Dry Tortugas, the westernmost portion of the Keys, recorded a minimum pressure of 970.2 mb. (28.65 in.) and a maximum sustained wind of 125 m.p.h. These were the extremes observed at any land station during the hurricane's existence. Gale force winds lashed exposed coastal sections in southern Florida for up to 22 hr., with rainfall averaging 5-8 in. over Dade, Broward, and Palm Beach Counties and 2-4 in. in other southern counties. Tides were less than 1 ft. above normal along the southeast coast but ran 2-3 ft. above normal from the Keys to St. Petersburg, and 3-5 ft. above normal in Tampa Bay.

Early on the 9th, Alma, moving north-northwestward, passed 50 mi. west of Tampa and by afternoon made landfall about 20 mi. east-northeast of Apalachicola. Crawfordville and Alligator Point estimated winds of 75-100 m.p.h. with an observed pressure of 984 mb. (29.06 in.), at Alligator Point. Intensity and forward speed diminished as the storm turned northeastward, moving east of Tallahassee and reaching south-central Georgia by evening. Gale force winds extended over most of northern Florida although their duration was considerably less than in the southern sections. Total rainfall amounts were generally 2-4 in. over the northern portions of the peninsula increasing to more than 6 in. in the path of the storm and decreasing rapidly over the western portion of the panhandle. The concave nature of the Florida coastline from Tampa to Apalachee Bay along with the offshore movement of the hurricane caused tides of 4-10 ft. above normal along this stretch of coastline.

Traversing southeastern Georgia late on the 9th and 10th, Alma diminished to a tropical storm, then moved north of Savannah, off the South Carolina coast, that afternoon. Gale force winds occurred in gusts along the coasts of Georgia and South Carolina, while precipitation totals averaged 2-4 in. in southeastern Georgia and along the South Carolina coast. Tides ran 2-3 ft. above normal. Alma continued moving east-northeastward out into the Atlantic and on the 11th-12th reintensified to hurricane strength for about 18 hr. On the 11th the 9,936-ton MARINE DOW-CHEM, within 50 mi. of the storm's center, reported an 86 m.p.h. wind and a 1000 mb.(29.53 in.) pressure while the 28,218-ton tanker MOBIL MERIDIAN reported a wind of 69 m.p.h. with a pressure of 1005.1 mb. (29.68 in.). The storm, however, diminished again as it swung northward. During this period coastal sections of North Carolina were battered by gale force winds, tides 2-5 ft. above normal, and 4-8 in. of rain. Gusty winds nearing gale force buffeted coastal areas from Virginia to New England as Alma continued to parallel the east coast. Early on the 13th the MARINE DOW-CHEM, racing the storm northward, reported a wind of 58 m.p.h. while about 60 mi. northwest of the storm's center. Later that afternoon the storm became extra-tropical about 120 mi. east-southeast of Atlantic City, New Jersey. The fast moving extra-tropical LOW turned northeastward late on the 13th, passing to the west of Cape Cod and out into the North Atlantic by the morning of the 14th.

Total storm damage in Florida was estimated near $10 million. A major portion of the damage resulted from tidal inundation and beach erosion. Hardest hit

TROPICAL CYCLONE DATA

# Tide above normal.
‡ Estimated.
† Mean low water.

was the Tampa-St. Petersburg region. Direct wind damage along the west coast was mainly to power and communication facilities, residential roofs, trees, and glass surfaces. Salt water inundation caused minor damage to roads and homes from the Keys to Apalachee Bay. Crop damage was most extensive in the northern farming areas where heavy rains and high winds damaged corn and tobacco fields. The mango crop in the southwest portion of the state and the grapefruit crop around Pinellas County were also hard hit. Storm damage in Georgia was estimated at $50,000--mostly beach erosion and tidal inundation damage--while other states suffered minor damage.

A total of 9 storm-connected tornadoes were reported during the hurricane's existence, 8 of them occurring in Florida. The tornadoes occurred at Cayman Brac, Cayman Islands (evening, June 6) southern Dade County (noon, June 8); near Miami (10:00 p.m., e.s.t., June 8); Jacksonville (afternoon, June 9). Three tornadoes occurred near Sarasota between 10:30 p.m. and 11:00 p.m. e.s.t., June 8. Two tornadoes occurred near Marianna at 6:00 a.m. and 10:00 a.m., c.s.t., June 9.

Alma claimed a total of 90 lives--6 in the United States. In Honduras 73 people were killed while 11 lost their lives in Cuba. The 6 in the United States were all in Florida.

HURRICANE BECKY, JULY 1-3

Hurricane Becky, developing at an unusually high latitude, appeared initially some 300 mi. southeast of Bermuda on July 1. Moving northeastward, the tropical storm intensified to hurricane strength near 38° N., 55° W., early on the 2d. The 6,795-ton Netherlands freighter LOPPERSUM, passing within 50 mi. of the storm's center, reported 68 m.p.h. winds with a pressure of 987 mb., (29.15 in.) at 0800. At 1245 the 7,508-ton German freighter JOHANNES RUSS recorded a pressure of 986 mb. (29.12 in.)--the lowest reported pressure in the storm's history. This ship also reported sustained 78-m.p.h. winds. Late on the 2d, as the storm turned toward the northwest, the USNS GEIGER reported winds of 63 m.p.h. gusting to 75 m.p.h. and a pressure of 991 mb., (29.26 in.). At this time Becky was located near 41° N., 54° W. On July 3 the storm, moving northwestward over the cold waters south of Newfoundland, weakened rapidly and lost its tropical characteristics. Early on the 4th Becky, now extratropical, was absorbed by a LOW moving off the southern coast of Labrador.

HURRICANE CELIA, JULY 13-21

Hurricane Celia formed about 200 mi. northeast of the Leeward Islands on July 13. Ship reports indicated winds up to 40 m.p.h. and there was evidence of an organized circulation. There had been earlier indications of disturbed weather in adjacent waters, but no history of a well-defined easterly wave or similar synoptic feature. On the 14th reconnaissance aircraft located a poorly defined cloud eye 40 mi. in diameter about 250 mi. north of San Juan, Puerto Rico. The 15,446-ton German bulk carrier JOHANN SCHULTE, some 120 mi. northeast of the storm's center, reported an east-southeast wind of 45 m.p.h. Following a west-northwesterly course for the next 4 days, Celia gradually degenerated into an area of showers, with sustained winds of less than 35 m.p.h. This area persisted, without evidence of a storm circulation, from the 15th to the 19th, passing over the Bahama Islands and turning northeastward just north of Nassau on the 19th. Early on the 20th, a ship under the southwestern edge of this cloud mass reported squalls with winds to 43 m.p.h. Intensification continued rapidly and when reconnaissance aircraft reached the area later, that same morning, winds had reached 80 m.p.h. and central pressure had dropped to 997 mb. (29.44 in.). The hurricane maintained this intensity as it raced north-northeastward at forward speeds up to 45 m.p.h. It finally began to weaken and lose tropical characteristics just before reaching western Newfoundland where it moved inland on the 22d, accompanied by squalls with winds to 45 m.p.h. The storm then became extratropical, merging with a frontal system over Labrador.

HURRICANE DOROTHY, JULY 22-31

Hurricane Dorothy was distined for a marine existence when it formed in the mid-North Atlantic, (31° N., 41° W.), 1,000 mi. from the nearest continent, on the 23d. The 21,291-ton Liberian tanker NAESS SEAFARER some 280 mi. north of the storm's center reported 45 m.p.h. winds. A satellite photograph revealed a dramatic spiral cloud pattern where only a small isolated area of clouds had existed on the previous day. After drifting slowly northward, Dorothy intensified to hurricane strength late on the 24th. Moving in a general northerly direction for the next 6 days the storm remained at minimum hurricane intensity, with a low pressure reading of 989 mb. (29.21 in.) on the 26th. Finally, early on the 29th, the hurricane decreased to tropical storm intensity about 500 mi. west-northwest of the Azores. On the 30th the storm, influenced by a huge cyclonic circulation to the west, turned toward the northwest and lost its tropical characteristics.

TROPICAL STORM ELLA, JULY 22-28

The fifth tropical cyclone of the season -- tropical storm Ella -- originated near 10° N., 35° W., on the 22d. This was only the fourth time since 1871 that five tropical cyclones developed in the North Atlantic before August. The initial circulation was discovered from ESSA 2 satellite pictures. Late on the 24th, near 17° N., 53° W., Ella reached tropical storm intensity; at this time maximum winds were 50 m.p.h. and central pressure was 1008 mb. (29.77 in.). Data from the storm were sparse during these first 3 days but subsequent reconnaissance flights on the 25th and 26th indicated the storm was developing slowly with no visual cloud eye and very poor circulation. The observed pressure never dropped below 1008 mb. (29.77 in.). Ella gradually turned from a west-northwesterly course toward the northwest with no significant change in size or intensity until midday on the 28th when it weakened into an area of squalls near 24° N., 68° W.

HURRICANE FAITH, AUGUST 21-SEPTEMBER 15

Hurricane Faith began as a poorly defined depression over the Ivory Coast of Africa on the 18th of August. Under satellite observations as it moved westward at a forward speed of about 20 m.p.h. the storm developed slowly, reaching tropical storm intensity on the 22d and hurricane strength on the following day near 15° N., 40° W. Generating winds of 85 m.p.h., Faith continued westward. Its center, passing 25 mi. north of St. Martin in the Leeward Islands on the 26th, reached a position north of the Dominican Republic the following day. The central pressure at this time was 983 mb. (29.03 in.). The storm then turned to a north-northwesterly course, slowed to a forward speed of about 5 m.p.h. and intensified rapidly.

For the next 3 days Faith held this course while winds increased to 120 m.p.h. and pressure fell to 963 mb. (29.44 in.). Late on the 31st Faith turned toward the northeast. On the 1st the storm passed about 205 mi. northwest of Bermuda generating maximum winds of 110 m.p.h. with gales extending out to 300 mi. in the southeast quadrant. The ALBERTO BENNATI, an Italian tanker located some 200 mi. west of Bermuda on the 1st (about 370 mi. from the storm's center), was crippled when 25-ft. seas generated by Faith flooded the engine room, killing one crewman.

Moving eastward Faith continued to deepen. Pressure fell to 950 mb. (28.05 in.) on the 3d, then later in the day the storm turned northeastward again, with its forward speed increasing to near 45 m.p.h. by the following day. Two men, attempting to cross the Atlantic in a row boat, drowned as the hurricane crossed their path. On the 6th Faith, now extratropical, passed over the Faeroe Islands and the following day moved inland near Nordoyan, Norway. Continuing as a deep low pressure system the storm moved across northern Norway, Sweden and Finland then turned northward over Novaya Zemlya. During the storm's trek across Scandinavia a Norweigian ferryboat, off the Denmark coast, was swamped. One person was killed. By the 12th the storm became a stationary 980-mb. (28.94 in.), LOW centered over Franz Josef Land, near 81° N., 60° E. The storm finally dissipated in the Arctic Ocean on the 15th.

TROPICAL STORM GRETA, SEPTEMBER 1-7

The circulation which spawned tropical storm Greta was first sighted by the NIMBUS 2 satellite some 600 mi. east of Barbados on September 1. An investigation by reconnaissance aircraft that same day revealed a weak circulation and an area of showers but no strong winds. The depression remained weak, generating maximum winds of 35 m.p.h. as it moved northwestward during the next 2 days. Moderate intensification occurred on the 4th as the storm passed about 200 mi. northeast of St. Martin. Reconnaissance aircraft indicated the depression had intensified to tropical storm strength as maximum winds reached 58 m.p.h. and central pressure dipped to 1004 mb. (29.65 in.)--the lowest pressure reported during the life of the storm. However, the following day the trend had reversed and Greta became very poorly organized. Highest reported surface winds were only about 35 m.p.h. in a few squalls. The system continued northwestward, still weakening, then turned to a northerly course some 300 mi. east of Nassau on the 7th. The cloud area associated with the dying surface circulation remained identifiable in satellite pictures through the 8th when it merged with a prefrontal cloud mass between the east coast of the United States and Bermuda.

TROPICAL STORM HALLIE, SEPTEMBER 20-21

Satellite photographs on the 18th indicated a large disorganized cloud mass was merging with a frontal cloud band in the southwestern Gulf of Mexico. The resulting circulation spawned tropical storm Hallie, on the 20th, some 120 mi. east-southeast of Tampico, Mexico. A. reconnaissance flight later that day reported a central pressure of 997 mb. (29.44 in.) with maximum winds of 50 m.p.h. Hallie, stationary while intensifying, began to drift southwestward late on the 20th. The Mexican coastal town of Nautla reported gusts of 40 m.p.h., heavy rain, and a minimum pressure of 1002 mb., (29.59 in.) early the following day, as the storm made landfall a few miles to the south. Once inland the storm weakened rapidly and, by late in the day, there was little evidence of circulation.

HURRICANE INEZ, SEPTEMBER 21-OCTOBER 11

Hurricane Inez, winding its way through the northern Caribbean Sea, the Straits of Florida and the Gulf of Mexico, paid unwelcome visits to Guadeloupe, Hispaniola, Cuba, the Bahamas, the Florida Keys and the Yucatan Peninsula before finally exhausting itself over the mountains of central Mexico. This great hurricane, with maximum winds of 150-175 m.p.h. and minimum pressure dropping to 927 mb. (27.38 in.) left a path of devastation, devastation which totals more than 1,000 dead and $200 million in damage.

Inez, organizing some 1,400 mi. east of the tropical island of Trinidad on September 21, spent the first 5 days of its 21-day existence in the development stage. Under the watchful eyes of reconnaissance aircraft the storm matured to hurricane strength, while maintaining a west-northwesterly track and a forward speed of about 12 m.p.h. Inez reached hurricane intensity on the 26th but it was not until the following day that its effects were first felt on land.

Generating winds up to 120 m.p.h., with a central pressure of 961 mb. (28.38 in.), hurricane Inez battered the Leeward Islands from Antigua to Dominica with hurricane force winds, as its center passed over Guadeloupe on the 27th. Strong winds, high tides and torrential rains in Guadeloupe destroyed thousands of homes as small villages were virtually swept away. Total damage has been estimated near $50 million with 27 people killed and about 600 injured.

Hurricane Inez, continuing to intensify, traversed the eastern waters of the Caribbean and by the 28th was buffeting the southern coast of Puerto Rico with gale force winds. Although the storm was generating maximum winds of 150-175 m.p.h. near its center, with a minimum pressure of 932 mb. (27.52 in.), the island was spared most of its fury when the storm's center passed about 75 mi. to the south. Maximum winds reached 30 m.p.h. with gusts to 52 m.p.h. along the southern coast. Mona Island, a short distance west of Puerto Rico, estimated winds near 70-80 m.p.h. on the evening of the 28th.

Early on the 29th Inez reached its peak intensity when the central pressure dropped to 927 mb. (27.38 in.) while generating maximum winds of 150-175 m.p.h. and hurricane force winds outward 70 mi. from the center. Lashing the southern coast of the Dominican Republic, the severe hurricane made its way to the Barahona Peninsula where winds of 115 m.p.h. or more raked the entire peninsula and tides 10-15 ft. above normal inundated the entire southern coast of the Dominican Republic. After ravaging the Barahona Peninsula, Inez turned its full fury on Haiti. Moving through the "Valley of Death," a deep trough between two mountain ranges on the Tiburon Peninsula of Haiti, the storm touched off torrential rains and local winds may have well exceeded 160 m.p.h. Accelerating northwestward Inez passed over the island of Gonave late on the 29th, pounding western Haiti with hurricane force winds, torrential rains and 10-15 ft. tides which flooded the northern shores of the Tiburon Peninsula.

TROPICAL CYCLONE DATA

† Mean low water.

Total damage in Hispaniola was estimated near $32 million -- $12 million in the Dominican Republic and $20 million in Haiti. Between 74 and 100 people lost their lives in the Dominican Republic while a rough estimate in Haiti puts the figure at 750. (In 1963 hurricane Flora moved through the same area in Haiti killing some 5,000 people and causing $125 million worth of damage.) Estimates of 1,000 people injured in Haiti and 450 seriously injured in the Dominican Republic have been reported.

After battering Hispaniola for more than 24 hr., Inez moved into the Caribbean again and reorganized for its invasion of Cuba. On the 30th of September the hurricane pushed into southeastern Cuba between Guantanamo City and Santiago. Minimum pressure at this time was near 985 mb. (29.09 in.) and Guantanamo City reported a sustained wind of 138 m.p.h. The U.S. Naval Base at Guantanamo Bay was hammered as the storm crossed Oriente Province; none of the base personnel were seriously injured. More than 125,000 people were evacuated from low-lying coastal areas and only one death was reported as 6- to 10-ft. tides swept the southeastern coast. Cuba's Sierra Maestra Mountains left Inez weak and disorganized. Drifting northwestward, the storm spread heavy rains and strong winds over most areas in Oriente Province. Early on the 1st of October Inez turned westward and moved into the Gulf of Guacanayabo. Remaining over water only briefly, the weak storm turned northward and moved inland again near Trinidad, Cuba. Poorly organized and generating below hurricane force winds, Inez drifted northward and moved off the coast north of Santa Clara early on the 2d. Maximum winds at this time were 52 m.p.h. and central pressure had risen to 994 mb. (29.35 in.).

Inez, moving into the Florida Straits, regenerated to hurricane strength late on the 2d some 95 mi. south-southeast of Miami. About this time the revitalized hurricane spawned a tornado in Nassau which killed one person and injured three others as it ripped across New Providence Island. Following a north-northeast course Inez continued to intensify; its renewed violence was felt on the 3d when a 23-ft. boat with 46 Cuban refugees aboard, sank in high seas about 35 mi. south of Miami with only one survivor. Maximum winds increased to 85 m.p.h. and pressure dipped to 985 mb. (29.09 in.) as storm-generated gales battered the southeast Florida coast and the northern Bahama Islands. Inez moved just east of the Bimini Islands (100 mi. east of Miami) where it stalled for about 8 hr. and then, unexpectedly turned west-southwestward toward the Florida Keys. Minor flooding occurred in the Bahamas as 1 ft. of water poured into Nassau's main street. Four people were killed, bringing the total in the Bahamas to five. Communication facilities were disrupted and total damage was estimated at $15.5 million.

About 60 mi. north of Nassau the 17,243-ton Liberian freighter, VERONA, was disabled in high seas and 75 m.p.h. winds, but managed to ride out the storm when Coast Guard cutters were unable to reach her. As Inez moved toward the Keys a 353-ft. Panamanian vessel, the FREIGHT TRANSPORTER was disabled 10 mi. off the mainland near Miami while an 82-ft Coast Guard Cutter, POINT THATCHER, was beached by gales and heavy surf just off Miami Beach.

The Miami area felt the brunt of the storm early on the 4th as the center passed 45 mi. southeast of the city. Maximum winds at the National Hurricane Center in Coral Gables reached 46 m.p.h. with gusts to 60 m.p.h., and the lowest pressure recorded was 995 mb. (29.38 in.) at 0713 e.s.t. Gales in the area occurred intermittently up to 35 hr., ending late on the 4th. Flamingo recorded the only sustained hurricane force wind on the mainland - south-southwest 81 m.p.h.

The Florida Keys, battered by gales early on the 4th, began to feel the full force of the storm on the afternoon of the 4th. Part of the eye passed directly over the Keys on its west-southwesterly journey. Slowly intensifying as it moved through the Keys, the storm dealt its strongest winds after the passage of the eye. Lowest recorded pressure in the Keys was 983 mb. (29.03 in.) at Islamorada. Highest measured winds were 98 m.p.h. at Plantation Key, however winds up to 150 m.p.h. were estimated at Big Pine Key.

Tides along the southeast coast of Florida and in the Keys were about 2-4 ft. above normal. Hurricane force winds in the Keys generally lasted about 4 hr. Damage in Florida -- including the Keys -- was restricted to Dade, Broward, and Monroe Counties and totaled about $5 million. Forty-eight people lost their lives; 45 were Cuban refugees in a small boat.

Located just south of Dry Tortugas early on the 5th, Inez, packing winds up to 105 m.p.h. with a central, pressure of 985 mb., (29.09 in.) headed away from the Keys on a west-southwesterly track. Once again Cuba -- this time the northwestern section -- felt the fury of hurricane Inez as the storm's center passed 60 mi. northwest of Pinar Del Rio Province early on the 6th. Havana reported 12 in. of rain in 30 hr. as coastal sections west of the capital were battered by strong winds, torrential rains and high tides. In the low-lying coastal areas of Havana Province 21,000 people were evacuated because of the flooding and 4 people lost their lives, bringing Cuba's total to 5. Thirty people were injured in Cuba and total damage was estimated at $18 million. After lashing Cuba, Inez turned toward the Yucatan Peninsula.

While Inez moved through the Bahamas to the Yucatan Peninsula many ship reports confirmed the intensity of the storm. On the 3d the TEXICO NORTH DAKOTA, about 25 mi. southeast of Miami, reported a north wind of 58 m.p.h. while the following day the P. W. THIRTLE, in the same area, reported a 98-m.p.h. easterly wind, accompanied by a pressure of 994.9 mb. (29.38 in.). Late on the 4th the ESSO LIMA passed near the eye of the hurricane and recorded a 105-m.p.h. wind with a pressure of 990.9 mb. (29.26 in.).

Intensifying slowly, the hurricane moved southwestward within 50 mi. of the extreme northeastern tip of the Yucatan Peninsula by late on the 6th. At this time central pressure was 961 mb. (28.38 in.) and maximum winds reached 105 m.p.h. Inez, changing to a westsouthwesterly course, paralleled the Yucatan coast, lashing the sparsely-populated coastal sections with hurricane force winds, high tides and torrential rains before departing late on the 7th. Evacuation of some 15,000 people from Progreso, in anticipation of the storm, held loss of life to a minimum.

By the 8th Inez was well out to sea (330 mi. southeast of Brownsville, Texas). Energized by the warm waters of the Gulf of Mexico, the storm intensified with maximum winds reaching 130 m.p.h. and pressure falling to 948 mb. (28.00 in.). The storm, continuing its erratic movement turned to a northwesterly track that threatened Texas.

For the next 24 hr. the hurricane drifted northwestward, weakening slightly, and by late on the 9th the center was located about 200 mi. southeast of Brownsville. The central pressure was 960 mb. (28.35 in.) and maximum winds were 130 m.p.h. Inez then turned toward the Mexican coast. On the 10th the hurricane moved inland about

40 mi. north of Tampico -- which reported 115 m.p.h. winds with gusts to 127 m.p.h. Tides 10-12 ft. above normal pummelled the coast just north of the eye, while torrential rains touched off extensive flash flooding in the southern half of the State of Tamaulipas. Soto la Marina, midway between Tampico and Brownsville, reported 10.12 in. of rain in 24 hr. Inez, moving inland over mountainous terrain, began to dissipate and, early on the 11th, about 70 mi. west of Tampico, finally exhausted itself. Mexico, hit extremely hard, reported 65 people killed with 250 injured and damage totaling an estimated $100 million.

TROPICAL STORM JUDITH, SEPTEMBER 27-30

An area of cloudiness in the south-central North Atlantic, on the 26th and 27th, gave rise to tropical storm Judith. On the 28th Judith, with a weak circulation, reached minimal tropical storm intensity near 12° N., 52° W. Moving west-northwesterly at about 20 m.p.h. the storm neared the Windward Islands on the 29th. At this time the central pressure was 1007 mb. (29.74 in.) and maximum winds were 52 m.p.h. As the storm passed through the Island chain later that day, Martinique, about 50 mi. north of the storm's center, reported a wind of 37 m.p.h. and a ship farther north reported a 40 m.p.h. wind. Judith moved into the eastern Caribbean and degenerated to an easterly wave early on the 30th.

HURRICANE LOIS, NOVEMBER 4-13

Lois, the sixth hurricane of the season was discovered as a tropical storm on the 6th near 24° N., 54° W. The storm reached hurricane intensity the following day as it moved northeastward at a forward speed of about 12 m.p.h. Maximum winds increased to 85 m.p.h. on the 8th with gales extending 100 mi. from the center. The storm's forward speed accelerated to 26 m.p.h. as Lois continued northeastward. Early on the 10th the hurricane passed about 24- mi. west of the Azores. At this time maximum winds, near the center, were still 85 m.p.h. The following day the 6,065-ton American freighter YAKA, some 250 mi. west of the storm's center, reported a northerly wind of 45 m.p.h. Lois, slowly degenerating, continued northeastward and early on the 12th the 7,548-ton Netherlands tanker SOESTDYK, about 210 mi. northwest of the storm's center, reported a north wind of 40 m.p.h. At this time the center was located near 46° N., 22° W. Later in the day the storm degenerated to tropical storm intensity and then became extratropical. The storm stalled as it neared 48° N., 18° W. For the next 2 days the extratropical storm continued to weaken as it drifted southward, finally dissipating, on the 14th, some 250 mi. northwest of Lisbon, Portugal.

** The Weather Bureau has for some time recognized that, without detailed expert appraisal of damage, all figures published are merely approximations to fact. Since errors in dollar estimates vary in proportion to the total damage, storms are placed in categories varying from 1 to 9 as follows

1 Less than $50	4 $5,000 to $50,000	7 $5,000,000 to $50,000,000
2 $50 to $500	5 $50,000 to $500,000	8 $50,000,000 to $500,000,000
3 $500 to $5,000	6 $500,000 to $5,000,000	9 $500,000,000 to $5,000,000,000

Blank spaces indicate no figures available.

* Including hurricanes.

# Not reported in literature, believed minor.

+ Additional deaths for which figures are not available.

TROPICAL CYCLONES IN THE EASTERN NORTH PACIFIC, 1966

Robert A. Baum
Weather Bureau, Environmental Science Services Administration
San Francisco, California

Seven hurricanes and six tropical storms in the Eastern North Pacific Ocean during the 1966 tropical cyclone season made the year the most active on record. In addition, five tropical depressions were identified but failed to develop to storm intensity.

Of the 13 major storms, only three were first identified in weather satellite pictures, the remainder being first indicated by merchant ships on the high seas and developing between satellite passes or in areas where pictures were unobtainable.

A total of 289 tropical cyclone advisories were issued on 56 days of the 1966 season. The storms, with winds in excess of 33 kt., were distributed as indicated in Table 1.

During one period, September 10 and 11, four tropical cyclones were active at one time in the Eastern North Pacific Ocean, while a fifth was located in the Honolulu area of responsibility. The four in the San Francisco area included Francesca, Gretchen, Helga and Ione.

Aircraft reconnaissance of storms was provided in eleven cases; aircraft were dispatched beyond their normal range on eight occasions and in only one case was a storm within the accepted range of the aircraft when reconnaissance was not attempted. In that case reconnaissance was accomplished on two previous and two successive days.

Table 1. Distribution of Tropical Cyclones, 1966, Eastern North Pacific Ocean

	May	June	July	Aug.	Sept.	Oct.	Nov.	Total
Number of Tropical Cyclones	0	1	0	4	6	2	0	13
Number of days with winds in excess of 33 kt.	0	3	0	22	26	5	0	56

The ROBERT D. CONRAD passed through the eye of Hurricane Eileen between 0745 and 0810 on August 26, near 19° 56' N., 123° 28' W. Radar presentation indicated the eye of the cyclone was elliptical in shape and about 8 by 12 mi. in size. Hurricane winds of 60 to 70 kt. with gusts to 80 were measured but were encountered only about 5 mi. before entering and after passing the eye. Torrential rain with near zero visibility occurred within about 10 mi. of the center. The barograph trace for the passage is shown in figure 1. Satellite pictures taken 10 hr. after the ship's intrusion into the eye of the storm suggested maximum sustained winds of 68 kt.

Weather satellite surveillance of tropical cyclones was more complete this year than previously. Greater areal coverage was possible through the use of near polar orbits, space oriented equipment, and infra-red night-time observations. Of the 289 advisories issued, the preparation of 96 involved the use of satellite photographs to determine the location and intensity of the storm. In 49 of these cases the satellite data was all that was available.

Cooperation with other stations with automatic picture equipment was good. Honolulu, Vandenberg Air Force Base, Point Mugu, Albuquerque and El Paso were consulted when the satellite was beyond the horizon from San Francisco.

Infrared equipment was available only at the National Environmental Satellite Center in Washington, D. C., but in three cases, telephone calls alerted San Francisco to important changes in character of storms.

The season was not without destruction. While no damage was reported to shipping either at sea or in harbors, the four storms that moved inland over Mexico brought destruction, and two of the storms cost at least 14 lives.

Hurricane Adele moved inland near 18.3° N., 103.3° W. at 0900 June 24 leaving hundreds of houses damaged or destroyed and at least 8 dead. Hurricane Helga moved inland on the coast of Baja California near 26.5° N., 113.0° W., at 1200 September 15. In a letter from Luis Salido, Amateur Radio Net Control Officer for Baja California, damage was alluded to in the following excerpt: "Fortunately little damage was done in the village of Ascencion but as all fishing boats were advised opportunely, none were taken by surprise, so we did not resent any losses."

Tropical storm Kirsten moved inland near 26.3° N., 109.3° W., at 0000 September 29. Damage included 180 houses heavily damaged or destroyed and 6 dead. Tropical storm Maggie moved onshore near 19.0° N., 104.8° W., at 0000 October 19 with no reports of damage or deaths.

Summaries of the individual tropical cyclones follow. All time references are in GMT. Tracks shown are for those cyclones which reached at least tropical storm intensity. Highlights are summarized in Table 2.

HURRICANE ADELE, JUNE 20-24, 1966

The first tropical cyclone of the year in the Eastern Pacific Ocean started in a squally area in the tropical convergence zone about 175 mi. south of Acapulco, Mexico, on June 19. The tropical depression, moving northwestward at 4 kt. developed into a tropical storm early on the 21st. Continuing its slow movement but in a more westerly direction the storm became a hurricane late on the 22d, about 150 mi. south of Manzanillo, and then made a sharp turn northeastward, to head toward the coast. Winds of 64 kt. were reported by the FLYING ENTERPRISE and 63 kt. by the KENNETH McKAY just before the storm went ashore about 100 mi. southeast of Manzanillo at 0900 June 24. The storm dissipated soon after going ashore but still caused considerable flooding and 8 deaths. No damage was reported to shipping.

HURRICANE BLANCA, AUGUST 2-12, 1966

Squalls and showers covered a large area of the Eastern Pacific Ocean during the latter part of July, and on August 2 a tropical depression formed about 180 mi. south of Clarion Island. The depression, moving west-northwestward at 10 kt., developed into a tropical storm within 6 hr. of its identification and continued on a west-northwesterly heading at about 10 kt. with maximum winds of 55 kt. By 0000 of the 5th, the storm increased to hurricane strength near 20° N., 126°W., but maintained hurricane winds for only 18 hr.; it was downgraded to a tropical storm with 60 kt. winds at 21° N., 131° W., at 1800. Continued weakening diminished the storm to a depression early on the 7th and it could not be identified as a closed circulation from ship reports or satellite pictures on the 8th. Remnants of the storm moved northwestward and regeneration became apparent on the 9th near 25° N., 147° W., when it was again identified as a tropical storm. It then moved northwestward at about 15 kt. to 31° N., 159° W., with maximum winds 40 to 50 kt. The storm again weakened to a tropical depression at 31° N., 165°W., early on the 12th. Further weakening made it impossible to find on the weather charts so the depression was dropped.

The path of Blanca was one of the longest on record for an Eastern North Pacific tropical cyclone. From its beginning as a tropical disturbance on July 31 to its final dissipation on August 12 the storm covered 4,300 mi. of ocean. It was observed by 3 different satellites each day, by Air Force reconnaissance, by civil aircraft from at least 4 nations, and by merchant vessels of diverse registry.

HURRICANE CONNIE, AUGUST 7-17, 1966

Hurricane Connie was first detected as a tropical storm early on the 7th near 14° N., 122° W. The storm, tracked by satellite as it moved westward, intensified slightly and, on the 10th, maximum winds reached 60 kt. while gale force winds extended about 100 mi. in all directions. Located near 15° N., 132° W., at 1200 on the 10th, it moved west-northwestward for the next few days, with little change in intensity. On the 13th, some 700 mi. east-southeast of Hilo, Hawaii, Connie reached hurricane intensity and began moving westward again. Winds reached 75 kt. with gales extending about 200 mi. in all directions as the storm headed toward the Hawaiian Islands at a forward speed of about 10 kt. Late on the 15th, some 400 mi. east-southeast of Hilo, Connie decreased to tropical storm intensity and winds dropped to 45 kt. The storm, continuing westward, passed about 200 mi. south of the island of Hawaii, and on the 17th degenerated to a weak depression some 430 mi. south of Oahu.

HURRICANE DOLORES, AUGUST 16-26, 1966

Hurricane Dolores was discovered as a tropical storm, some 260 mi. southwest of Acapulco, Mexico, on the 16th. During the next 2 days it moved toward the west-northwest at a forward speed of about 10 kt. Late on the 18th, the storm, after crossing the 15th parallel some 800 mi. west-southwest of Acapulco, intensified to hurricane strength and turned to a northwest heading. Winds increased to 75 kt., but within 24 hr. dropped below hurricane intensity as Dolores turned toward the west-northwest. For the next 5 days the storm, following a west-northwest course and gradually diminishing in intensity, covered a little more than 1,000 mi. before finally stalling and dissipating near 26° N., 136° W., on the 25th.

HURRICANE EILEEN, August 23-29, 1966

Eileen, the 5th hurricane of the season in the Eastern Pacific, began as a tropical depression some 600 mi. west of Acapulco, Mexico, early on the 23d. For the next 3 days the storm slowly intensified while moving west-northwestward at a forward speed of about 10 kt. On the 26th, near 20° N., 123° W., winds increased to 70 kt. and Eileen became a hurricane for some 24 hr., turning northwestward before diminishing to tropical storm intensity. The storm then recurved to the north-northeast and, early on the 29th, dissipated near 26° N., 129° W. The ALCOA MARKETER encountered 50 kt. winds on the 24th near 18.1° N., 115.4° W., and the ROBERT D. CONRAD passed through the eye of the storm near 19.9° N., 123.5° W., early on the 26th, encountering winds of 60-70 kt., with gusts to 80 kt.

HURRICANE FRANCESCA, SEPTEMBER 5-16, 1966

Hurricane Francesca was spawned about 200 mi. southwest of Acapulco, Mexico, on the 5th. Early on the 6th reports from the GARDEN CITY, the NAGARA MARU, the TRANSOCEAN MERCHANT and the AMERICAN CONTRACTOR indicated the depression deepened rapidly as it moved west-northwestward and late on the 6th had reached hurricane intensity some 600 mi. west of Acapulco. For the next 3 days Francesca, at a minimum hurricane intensity, moved toward the west at a forward speed of about 8 kt. Late on the 9th, Francesca degenerated to tropical storm intensity, moving southwestward to near 14° N., 130° W., on the 12th. It then recurved northeastward and dissipated near 21° N., 125° W., on the 16th.

TROPICAL STORM GRETCHEN, SEPTEMBER 7-11

Tropical storm Gretchen was first identified late on September 7 from satellite pictures. The storm was located near 17° N., 129° W°, with maximum winds of 48 kt. It moved west at 6 kt. through the 8th; southwest at 10 kt. through the 11th; and west at 8 kt. until dissipating late on the 11th near 13° N., 142.5° W.

HURRICANE HELGA, SEPTEMBER 9-15, 1966

Early on the 9th hurricane Helga formed about 60 mi. east of the initial location of hurricane Francesca. Intensifying slowly, the storm moved west-northwestward for the next 3 days and on the 12th was located about 900 mi. due west of Acapulco, Mexico. Turning northward Helga attained hurricane intensity late on the 12th as maximum winds reached 75 kt. Early on the 14th the storm diminished to tropical storm intensity about 300 mi. west of La Paz, Baja California. Helga then recurved eastward and, on the 15th generating winds of 50 kt., it moved inland over the Baja California peninsula and dissipated.

TROPICAL STORM IONE, SEPTEMBER 10-14, 1966

Reports from the CHUNGKING VICTORY, the POLAR STERN and the PACIFIC RELIANCE indicated that tropical storm Ione formed about 400 mi. southeast of Acapulco, Mexico, late on the 10th. In the tropical depression stage, the storm moved northwestward for 2 days, reaching tropical storm intensity late on the 12th some 150 mi. south of Acapulco. It then dissipated quickly. By the 14th a definite circulation was no longer evident.

TROPICAL STORM JOYCE, SEPTEMBER 14-20, 1966

Tropical storm Joyce, a tropical depression for all but 24 hr., formed late on the 14th some 480 mi. west-southwest of Acapulco. For the next 4 days the depression moved westward. Joyce covered a distance of some 600 mi. before recurving northward early on the 18th and reaching tropical storm intensity with maximum winds of 35 kt. Joyce turned counterclockwise to the southeast on the 19th and on the following day, dissipated near 15° N., 118° W.

TROPICAL STORM KIRSTEN, SEPTEMBER 25-29

On the 28th tropical storm Kirsten became the second storm of the month to sweep across the Baja California Peninsula, moving inland from the southwest and passing just north of La Paz. Generating 50-kt. winds as it approached the coast, the storm traversed the Gulf of California before dissipating near Navojoa, Mexico, on the 29th. Kirsten had formed some 400 mi. southwest of La Paz on the 25th and reached tropical storm intensity about 200 mi. southwest of La Paz early on the 28th. Reports from the ADELPHI VICTORY, ALLISON LYKES, APALACHEE and CONSTITUTION STATE helped forecasters track the storm.

TROPICAL STORM LORRAINE, OCTOBER 4-5, 1966

Lorraine formed October 4 at 0000 about 180 mi. west-southwest of Acapulco, Mexico, as a tropical depression moving north at 5 kt. Moderate to heavy rain and 20 - 40 kt. winds were reported by the CHARLES LYKES, NEGAMO, MONTPELIER VICTORY and SUNEK on that day. Just before 1200 on the 4th the cyclone reached tropical storm intensity. It continued moving northward, reaching the coast early on the 5th where it dissipated about 100 mi. southwest of Manzanillo, Mexico.

TROPICAL STORM MAGGIE, OCTOBER 16-19, 1966

A late season tropical depression formed October 16, 360 mi. southeast of Acapulco, Mexico. The depression was moving northwest at 10 kt. and developed into tropical storm Maggie about 100 mi. southwest of Acapulco at 0400 on the 18th. Continuing northwestward, the storm moved onshore about 20 mi. west of Manzanillo early on the 19th. Heavy rain spread inland to Guadalajara but no reports of damage have been received.

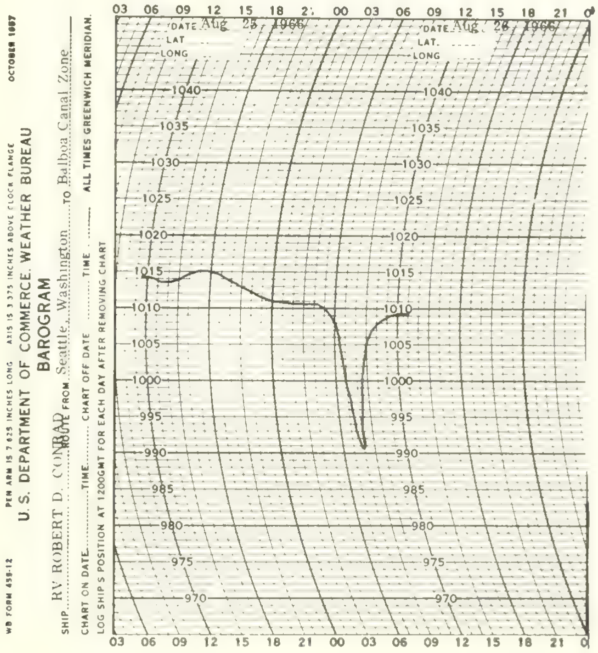

Fig. 1 Hurricane Eileen barogram from R/V ROBERT D. CONRAD August 25-26, 1966. Low barometer reading at 19°56'N., 123°28'W., at 0800 on August 26.

TYPHOONS OF THE WESTERN NORTH PACIFIC, 1966

Based on the report of the Joint Typhoon Warning Center,
Fleet Weather Central, Guam, Mariana Islands

The 1966 typhoon season began on April 3 and extended through the final day of the year. During this period 20 typhoons, 10 tropical storms and 8 tropical depressions harried shipping in the western Pacific. Major land areas were directly in the path of 13 typhoons. Mainland China and the Ryukyu Island chain were struck 5 times.

The number of typhoons was close to the latest 10 year average (1957-1966) of 20.4 (see table). Only 3 super typhoons (maximum winds 130 kt. or more) developed this year as compared to a record number of 11 in 1965. The most intense was typhoon Kit (22-28 June) which generated maximum sustained surface winds of 170 kt. with a minimum central pressure below 914 mb. August was the most active month with six typhoons while 65 percent of the total occurred from July through September. Four typhoons developed in the South China Sea while 12 originated within 450 mi. of Guam.

In the following narrative summary of tropical cyclones that reached typhoon strength, and in the accompanying tables and figures, typhoon intensity indicates wind speeds of 64 kt. or more; tropical storm intensity, 34 to 63 kt.; tropical depression intensity, less than 34 kt. All distances are in nautical miles and all times in Greenwich Mean Time. Dates given for individual tropical cyclones indicate the periods during which warnings were issued. Storm tracks and maximum winds presented are based on post analysis.

TYPHOON FREQUENCY

HESTER, APRIL 3-14

Typhoon Hester, the first North Pacific tropical cyclone of the year, was discovered in its tropical depression stage early on the 3d some 150 mi. south of Kwajalein. The initial central pressure was 1001 mb. and maximum winds were 25 kt. After remaining stationary for 12 hr. the storm moved west-northwestward accelerating to a forward speed of 19 kt. by the 5th. Maximum winds were now 35 kt. but the central pressure was still high at 1000 mb. Early on the 6th the center began to fill; central pressure rose to 1004 mb. and maximum winds diminished to 30 kt. Late in the day the original center was no longer discernible. However, a new vortex appeared in the circulation some 300 mi. to the south near 8° N., 149° E.

Hester, with new impetus, began to deepen and early on the 7th reached tropical storm, intensity 350 mi. east of Yap Island; maximum winds were 35 kt. and minimum pressure was 1001 mb. Continuing to deepen the storm moved west-northwestward at forward speeds of 15-20 kt. Hester reached typhoon strength early on the 10th some 250 mi. northeast of Mindanao in the Philippines; maximum winds were 65 kt. with a central pressure of 993 mb. The following day the typhoon reached its peak intensity generating 85-kt. winds while centered about 200 mi. east of central Luzon. The lowest central pressure - 979 mb. - was attained on the 12th as Hester was recurving northward at forward speeds of 4-6 kt. The storm then began to dissipate and fell to tropical storm intensity the following day some 200 mi. northeast of the northern tip of Luzon. By the 14th Hester dissipated about 250 mi. south of Okinawa.

IRMA, MAY 11-22

Typhoon Irma originated on the 11th some 170 mi. east of Koror, in the Palau Islands. Initial central pressure was 1004 mb. with maximum winds of 25 kt. Rapidly intensifying, the storm reached typhoon strength early the next day; maximum winds were 75 kt. and central pressure was 988 mb. as the storm passed 130 mi. northwest of Koror. On the 13th and 14th Irma fluctuated between typhoon and tropical storm intensity as it headed west-northwestward toward the Philippines.

Finally on the 15th, the storm deepened significantly when the central pressure fell to 973 mb. Generating 100-kt. winds, Irma ripped into the Islands slashing across Samar and northern Leyte. On the 16th the typhoon moved across the Visayan Sea where its 100-kt. winds churned up mountainous waves. The PIONEER CEBU, a 720-ton inter-island steamer carrying 262 passengers, encountered these waves and capsized after grounding on Malapascua Island; 5 people were reported dead and 116 missing. On the 17th, Irma attained its greatest intensity when maximum winds reached 120 kt. and minimum pressure fell to 970 mb. The typhoon continued to batter the coconut and sugar islands south of Luzon, leaving at least 13 dead ashore as well as a trail of wrecked houses and sunken fishing boats. Turning northwestward on the 18th, the storm entered the South China Sea off southwestern Luzon. Continuing to recurve, Irma moved northward along the west coast of Luzon battering coastal sections from Manila Bay to Baguio with 75-to 80-kt. winds before diminishing to tropical storm intensity late on the 19th. Reaching the Luzon Strait, the storm moved rapidly northeastward through the Philippine Sea, becoming extratropical on the 22d about 130 mi. east of Okinawa.

JUDY, MAY 25-31

On May 25 satellite pictures revealed a tropical depression had formed in the South China Sea, about 250 mi. west of Manila. Reconnaissance aircraft reports, later in the day, indicated the depression had intensified into tropical storm Judy. Heading northward, the storm reached typhoon strength late on the 26th some 170 mi. northwest of Manila. On the 27th the central pressure had deepened to 982 mb. while maximum winds reached 85 kt. About 0600 on the 27th the USNS CARD, just northeast of the storm's eye, reported 80-kt. winds and 30.5 ft. seas. The lowest pressure in the storm's history - 970 mb. - was observed near 19.2° N., 116.7° E., early on the 28th. Typhoon Judy moved north-northwestward to within 160 mi. of Hong Kong before recurving northeastward on the 29th. Turning eastward the following day, Judy began to weaken and just prior to making landfall in southern Taiwan maximum winds diminished to 60 kt. while central pressure rose to 996 mb. At Takao Ko, Taiwan the 7,198-ton Panamanian TEMPO, with its anchor snapped by the storm and leaking in all holds, was driven aground outside the northern breakwater. Once inland the tropical storm broke up in the mountainous regions of Taiwan. On the 30th the ill-defined center reappeared east of Taiwan. However, a new vortex in the circulation, discovered along the northwestern coast about 70 mi. southwest of Taipei, became the predominant center. The storm, generating 40-kt. winds with a central pressure of 996 mb., moved across northern Taiwan and into the East China Sea. On the 31st, Judy, paralleling the Ryukyu Island chain, moved northeastward finally becoming extratropical about 130 mi. south of Shikoku Island.

KIT, JUNE 22-28

Super typhoon Kit was a mere tropical depression about 130 mi. east-southeast of Yap Island on the 22d. Entering the Philippine Sea on a west-northwesterly course, Kit attained tropical storm strength early the next day. Maximum winds had increased to 40 kt. while minimum pressure had dropped to 998 mb. Late on the 23d 65-kt. winds indicated that Kit had matured to typhoon strength some 300 mi. west-northwest of Yap Island. Rapid intensification continued as the typhoon began turning northward. Early on the 25th central pressure was 965 mb. and maximum winds were 80 kt. During the next 18 hr. pressure fell 51 mb. to 914 mb. and maximum winds more than doubled, reaching 170 kt. This was the peak intensity and it occurred with the storm centered some 500 mi. east of the Philippines near 18.3° N., 130.7° E. Typhoon Kit gradually began to diminish as it turned toward the northeast at a forward speed of 15 kt. Late on the 26th, as the storm passed some 300 mi. east of Okinawa, maximum winds were measured at 150 kt. Late the following day maximum winds dropped below 100 kt. as central pressure rose above 960 mb. Continuing northeastward forward speed increased to 30 kt., as the storm passed 100 mi. east of Tokyo, around midday on the 28th. Maximum winds, at this time, were 65 kt. and both the ALLEGHENY VICTORY and the THOMPSON LYKES reported 60-kt. winds in the storm's southeast quadrant. The Tokyo-Yokohama area was hit hard; 44 people were killed, 21 were reported missing, 82 were injured, and 75 thousand were left homeless. Kit dropped to tropical storm intensity and finally became extratropical, later the same day, just south of Hokkaido. The storm was still potent in its extratropical stage, attested to by the 57-kt. winds encountered by the PHILIPPINE ADMIRAL some 200 mi. east of Hokkaido early on the 29th.

MAMIE, JULY 15-17

Typhoon Mamie developed in the western North Pacific on the 15th, some 300 mi. east of the northeast Luzon coast. Generating 30-kt. winds the storm moved west-northwestward influenced by a subtropical ridge of high pressure, which was to prevent recurvature. Early on the 16th tropical storm Mamie, with maximum winds of 45 kt. and a 992-mb. central pressure, moved over the Babuyan Islands just north of Luzon. Traversing the South China Sea it appeared that Mamie would reach land before attaining typhoon strength, but sudden intensification occurred late on the 16th. Maximum winds increased to 75 kt. and pressure fell to 987 mb. near 20.9° N., 117.1°E. Mamie was generating 85-kt. winds as it passed about 60 mi. south of Hong Kong early on the 17th. The typhoon began to weaken as it approached the South China coast, diminishing to tropical storm intensity as it moved inland near Yangchiang later in the day. Dissipation occurred rapidly following landfall.

NINA, JULY 17-20

Nina, a minimal typhoon at its peak, began as a tropical depression, near 21° N., 131° E., early on the 17th. In less than 24 hr. the storm reached typhoon intensity, when maximum winds increased to 65 kt. and central pressure fell to 995 mb., near 22.2° N., 128.2° E. However, upper level conditions became unfavorable and early on the 18th winds fell below typhoon intensity. Gradually diminishing, the tropical storm continued west-northwestward until early on the 19th when it abrubtly turned northward. At this point, about 150 mi. southeast of Taipei, Nina was generating maximum winds of 45 kt. while sporting a central pressure around 1005 mb. The storm, moving north-northwestward, continued to weaken, finally dissipating early on the 20th some 120 mi. north of Taipei.

ORA, JULY 23-26

Typhoon Ora, second of the season to originate in the South China Sea, began as a depression about 350 mi. west of Manila on the 23d. The storm remained quasi-stationary for 24 hr. while organizing and by early the next day maximum winds reached 35 kt. Moving northwestward at a forward speed of 10 kt. Ora continued to deepen during the day as maximum winds increased to 65 kt. and central pressure fell to 982 mb. The strength of the storm was attested to by the ANDREW JACKSON which encountered 30.5 ft. waves some 350 mi. east-southeast of the center. At 1800 on the 24th the PRESIDENT ARTHUR reported 48-kt. winds 250 mi. southeast of the storm's center, and 6 hr. later recorded 60-kt. winds. Generating its maximum winds -85 kt. - the 977 mb. typhoon brushed northeastern Hainan around midday on the 25th. Early the next day the degenerating storm moved inland across the Luichow Peninsula and into southern China. Once over land the storm began to weaken, finally dissipating that same day.

RITA, AUGUST 2-9

Typhoon Rita was discovered as a tropical depression, on the 2d, just north of Saipan in the Mariana Islands. Central pressure at this time was near 1003 mb. Rita, moving northward, reached tropical storm intensity just after crossing the 20th parallel late on the 3d. Maximum winds were clocked at 35 kt. while central pressure read out at 992 mb. The next significant change occurred about 170 mi. southeast of Iwo Jima, late the following day, when Rita attained typhoon strength as maximum winds reached 70 kt. and central pressure dipped to 987 mb. The typhoon, generating 80-kt. winds early on the 5th, passed about 120 mi. east of Iwo Jima moving on a north-northeasterly track. A short time later the central pressure dropped to 977 mb., lowest during the storm's history. Early on the 6th the STEEL VENDOR, some 240 mi. east-southeast of the storm's center, encountered 64-kt. winds while struggling in 30-ft. seas. Late on the 6th, however, winds began diminishing and were below 50 kt. as the storm crossed the 30th parallel near 145° E. The tropical storm moved northeastward for the next 2 days gradually acquiring extratropical characteristics. Early on the 7th the EXHIBITOR some 120 mi. east of the storm's center reported 50-kt. winds. The MARJORIE LYKES, 150 mi. southeast of the storm's center on the 8th, also reported 50-kt. winds. Generating 30-kt. winds the storm became extratropical early on the 9th near 35° N., 150° E. This still potent 988-mb. LOW remained intense as it moved east-northeastward across the North Pacific. On the 12th, still packing winds up to force 8 - and a central pressure of 990 mb. - the storm turned northeastward brushing the Aleutian Island chain before moving eastward and dissipating in the Gulf of Alaska the following day.

SUSAN, AUGUST 12-16

Early on the 12th typhoon Susan was discovered in its tropical storm stage some 300 mi. west-northwest of Manila in the South China Sea. Maximum winds were 35 kt. and minimum pressure was 1002 mb. at this time. The storm moved slowly northeastward attaining typhoon strength early on the 14th about 300 mi. northwest of Manila. Continuing to intensify maximum winds reached 80 kt. and central pressure dropped to 978 mb. just before the storm entered the Luzon Strait. The storm began to fill as it traversed the Luzon Strait on the 15th; central pressure rose to 985 mb. The NEW ZEALAND reported 40-kt. winds about 130 mi. south-southwest of the storm's center. Early on the 16th, near 23° N., 125° E., Susan was absorbed into the circulation of typhoon Tess.

TESS, AUGUST 12-17

Typhoon Tess originated as a tropical depression about 70 mi. east of Okinawa on the 12th. Generating 30-kt. winds with a 993 - mb. central pressure the storm moved westward over Okinawa early the next day. Reaching a point some 70 mi. west of Okinawa the storm stalled and began to deepen. It remained stationary for 18 hr. as winds increased to 40 kt. and central pressure fell below 988 mb. The FLYING DRAGON some 280 mi. north of the storm's center on the 13th encountered 36-kt. winds. Resuming its slow westward movement early on the 14th, Tess continued to intensify. Early the next day the storm reached typhoon strength, near 27° N., 125° E., as winds increased to 65 kt. and central pressure dipped to 976 mb. The lowest pressure - 972 mb. - was recorded late on the 15th and maximum winds reached a peak of 90 kt. early the following day. The storm finally made landfall just north of Fu-Chou, China, late on the 16th. Once inland the storm dissipated rapidly.

VIOLA, AUGUST 19-22

Typhoon Viola was initially detected as a tropical storm near 20° N., 147° E., on the 19th. Early in the day a reconnaissance aircraft reported 50-kt. winds and a 996-mb. central pressure while the LA PINTADA encountered 36 - kt. winds some 60 mi. south of the storm's center at 1200. Within 24 hr. of initial detection Viola was a full blown typhoon generating 65-kt. winds and containing a 975-mb. central pressure, the lowest pressure in the storm's history. Located near 22.5° N., 147.9° E., at 0000, the typhoon continued its northward trek. Early on the 21st, after a northwesterly turn, the storm passed 260 mi. northeast of Chichi Jima. Maximum winds were 90 kt. and central pressure was 978 mb. Accelerating to a forward speed of 25 kt., Viola began to weaken, making landfall on the coast of Japan as a tropical storm. Generating winds up to 45 kt. the storm crossed the Japanese coastline near Shizuoka (about 100 mi. southwest of Tokyo). Viola continued to weaken as it moved northwestward across rugged terrain finally becoming extratropical in the Sea of Japan, near 38.5° N., 134.5° E., late on the 22d. Damage from the storm was relatively minor since its most intense stage occurred over open water.

ALICE, AUGUST 25-SEPTEMBER 3

The initial impetus of typhoon Alice came from the combination of an easterly wave and a fractured polar trough near Guam on the 23d of August. A definite circulation was recognized early on the 25th some 300 mi. north of Guam. Maximum winds at this time were 35 kt. with a 1000-mb. central pressure. The tropical storm, moving due northward, reached typhoon strength late in the day. During the 26th through the 28th Alice moved into a loop pattern around the 145th meridian between 27° N. and 29° N. The typhoon, moving in a clockwise fashion, completed the loop late on the 28th.

Maximum winds increased to 70 kt. and minimum pressure dipped to 966 mb. during this period. From the completion of the loop until landfall typhoon Alice moved on a westerly track, at 10-12 kt., just north of the 25th parallel. Alice, generating winds up to 100 kt., was centered some 450 mi. east of Okinawa early on the 31st. Later that day the central pressure dropped to 937 mb. lowest in the storm's history. Peak winds in the super typhoon reached 130 kt. at 1200 on September 1 with the storm just 60 mi. east of Okinawa. Alice ripped through Naha, the capital city of the Ryukyu Islands, just 6 hr. later. After battering Okinawa and the surrounding islands, the slowly weakening storm continued westward across the East China Sea. Early on the 3d the typhoon passed about 70 mi. north of Taipei, Taiwan, and later in the day made landfall just south of Fou-Chou, China - very close to the point where typhoon Tess had passed less than 3 weeks before. Maximum winds were 60 kt. as Alice crossed the coastline; however, once inland the storm dissipated rapidly.

CORA, AUGUST 30-SEPTEMBER 9

Typhoon Cora was spawned just south of Guam early on the 30th. Initially a tropical depression Cora eventually attained super typhoon strength as winds roared up to 150 kt. and central pressure dipped to 917 mb. During its 11 day existence the storm traveled a distance of about 2,400 mi.

The depression, moving west-northwestward then northwestward, quickly reached tropical storm intensity as winds increased to 40 kt. and pressure dropped to 997 mb. late on the 30th. The storm continued to intensify and by early on the 1st of September, near 16° N., 137° E., Cora attained typhoon strength; maximum winds reached 75 kt. and minimum pressure fell below 965 mb. During the 1st and 2nd the typhoon continued to deepen as it moved northwestward at forward speeds of 10-12 kt. Centered near 23° N., 131° E., early on the 3d, typhoon Cora was generating 130 kt. winds around a central pressure of 934 mb. Once again the storm turned toward the west-northwest and forward speed slowed to 8 kt. Intensification continued as the typhoon approached the southern Ryukyu Islands. Generating 140-kt. winds around a 917-mb. central pressure Cora roared through the Sakishima group, late on the 4th, battering the islands with high winds, torrential rains and destructive floods. Once into the East China Sea the mighty typhoon continued to grow as maximum winds reached 150 kt. Cora moved 60 mi. north of Taipei, Taiwan, on the 6th, taking a heavy toll over northern sections of the island. Hemmed in by land the storm began to weaken but not before unleashing one more mighty blow, against the China mainland. Once again Fuo-Chou, was a prime target as Cora, still generating 140-kt. winds, made landfall less than 60 mi. northeast of Fou-Chou early on the 7th. Cora's intensity precluded quick dissipation over land and the storm turned northeastward weakening slowly. Early on the 8th, Cora, now reduced to tropical storm strength emerged from China into the Yellow Sea, about 130 mi. northwest of Shanghai. Traversing the Yellow Sea on a northeasterly course the storm continued to weaken and, with the intrusion of cold air became extratropical 30 mi. southeast of Seoul, South Korea, early on the 9th.

ELSIE, SEPTEMBER 11-18

Typhoon Elsie originated in the South China Sea, about 160 mi. west of the northern Luzon coast, late on the 11th. During these first few days of organizing the storm drifted erratically southward then northward. The MUHLENBERG VICTORY indicated the storm was intensifying rapidly when, late on the 12th, it encountered 60-kt. winds within 60 mi. of the storm's center. Early the next day a reconnaissance aircraft reported 70-kt. winds and a central pressure of 979 mb. On the 14th the typhoon began a definite north-northeasterly track. Elsie, near 20° N., 118° E., early in the day, was generating 85-kt. winds around a 969-mb. central pressure. The typhoon reached its peak intensity early on the 15th; maximum winds increased to 115 kt. and central pressure dipped to 943 mb. The storm had been moving at forward speeds of 3-5 kt. but now began to accelerate as it turned east-northeastward toward Taiwan.

Generating 100-kt. winds Elsie slashed across the southern tip of Taiwan early on the 16th. The PRESIDENT MONROE, some 120 mi. southwest of the storm's center, reported 54-kt. winds just after the storm had crossed Taiwan; at this time maximum winds were 80 kt. with a 979-mb. central pressure. The typhoon began to fill as it accelerated northeastward through the southern Ryukyu Islands into the East China Sea. By the 17th Elsie was a tropical storm, paralleling the Ryukyu Islands. The storm became extratropical on the 18th before reaching Kyushu, Japan.

FLOSSIE, SEPTEMBER 12-18

Early on the 12th a circulation was discovered, in its formative stage, near 20° N., 143° E. The tropical depression drifted westward during the day but by early on the 13th there was little evidence of an organized system. Satellite pictures showed some cloud bands during the day. Early the following day it was apparent that regeneration had occurred, near 22° N., 143° E., when reconnaissance aircraft reported winds up to 45 kt., a central pressure of 988 mb. and an eye 10 mi. in diameter.

Typhoon Flossie, after its rather unusual beginning, assumed a normal pattern of development as it accelerated northeastward. Generating 50-kt. winds around a 975-mb. pressure center, the storm crossed the 25th parallel near 146° E., late on the 15th. Flossie, moving north-northeastward, reached typhoon intensity on the 16th as maximum winds increased to 75 kt. and pressure dipped to 963 mb. After reaching this peak the storm began to weaken as it turned northeastward on the 17th. Late in the day the DEL ALBA encountered 60 kt. winds some 230 mi. northwest of the storm's center. However, the intrusion of cold air spelled the end for Flossie and, early on the 18th, the storm became extratropical near 34° N., 152° E.

IDA, SEPTEMBER 22-25

Typhoon Ida, while not the most intense storm of the year, became one of the most destructive when it roared through central Honshu on the 24th. In addition to widespread damage, estimated at $300 million, 197 people were killed with 123 more unaccounted for. Torrential rains set off huge landslides and Mt. Fuji observatory reported a wind gust of 175 kt. Ida's 100-kt. surface winds played havoc with vessels ranging in size from coastal traders to bulk carriers, causing sinkings, groundings and collisions. The 7,702-ton cargo liner, CITY OF WELLINGTON and the Japanese freighter JUTOKU MARU were driven ashore near Yokohama. The 1,193 ton KAIYA MARU capsized off Tsurumi losing one crewman with eight others missing, while the 10,208-ton Chinese freighter EVERSURENESS was stranded at the mouth of the Tsurumi River. The 3,635-ton SRI THEP ran aground off Shizuoka; nearby at Shimizu the 24,829-ton Liberian tanker GOLAR JEANNE - MARIE also ran aground.

Ida originated near 16° N., 151° E., about 300 mi. east-northeast of Saipan, early on the 22d. At this time maximum winds were 35 kt. while minimum pressure was 992 mb. Accelerating west-northwestward at a forward speed of 20 kt., the storm reached typhoon strength later in the day as winds increased to 65 kt. and central pressure dropped to 965 mb. The following day Ida began to recurve northward. The typhoon reached peak intensity early on the 24th as 100-kt. winds were generated around a 961 mb. pressure center, setting the stage for the big blow. Ida, racing northward at a 35 kt. pace, roared up Yaizu Bay and into central Honshu. Passing 60 mi. west of Tokyo the storm began to weaken and it re-entered the Pacific near 40° N., on a northeasterly heading. Maximum winds dropped to 45 kt. and Ida became extratropical about 240 mi. east of southern Hokkaido early on the 25th.

JUNE, SEPTEMBER 22-29

Typhoon June appeared initially as a tropical depression, near 11° N., 144° E., early on the 22d. At this time maximum winds were 30 kt. and central pressure was 996 mb. The depression deepened to tropical storm intensity as it moved west-northwestward during the day. Late in the day the storm turned northward. Maximum winds climbed to 60 kt. on the 23d and pressure dipped to its lowest reading - 962 mb. However, late in the day the storm began to weaken as it crossed the 15th parallel near 142° E. Intensity remained steady during the next 24 hr. as the storm moved northeastward at a forward speed to 12 kt. On the 25th the tropical storm turned in a small counter-clockwise loop near 19° N., 137° E. June reached typhoon strength, near 20° N., 139° E., early the next day. Maximum winds were clocked at 65 kt. around a 983 mb. pressure center. The typhoon, accelerating northeastward, continued to deepen and was generating 70 kt. winds as it passed 30 mi. east of Iwo Jima early on the 27th. Later in the day the GENERAL W. H. GORDON, some 240 mi. northeast of the storm's center encountered 45-kt. winds as did the PINE BLUFF VICTORY about 120 mi. southeast of the center early on the 28th. A few hours later June reached its peak intensity when winds increased to 95 kt. Still moving northeastward the forward speed increased to 40 kt. during the day and cold air began to intrude into the circulation. Finally on the 29th the storm became extratropical, near 46° N., 164° E., but was still generating 45-kt. winds as it sped northeastward.

KATHY, OCTOBER 8-20

Typhoon Kathy began as a tropical depression near 18° N., 151° E., early on the 8th. Four days later the storm reached typhoon strength only 120 mi. north of its origin. In the intervening period Kathy turned a clockwise loop near 20° N., 151° E. The typhoon turned toward the northeast and continued to intensify. By the 14th Kathy was generating 100-kt. winds around a 947-mb. center as it crossed the 25th parallel near 155° E. These were the extremes during the storm's history. Heading east-northeastward the typhoon crossed the 30th parallel near 164° E., early on the 16th. Maximum winds, at this time, were 80 kt. while central pressure was 954 mb. During the day the KYSKA, about 280 mi. from the storm's center, reported a 55-kt. wind. Remaining intense, Kathy turned northeastward again on the 18th. Maximum winds were clocked at 90 kt. around a 964-mb. pressure center. The MUHLENBERG VICTORY, some 200 mi. east of the center, reported winds of 55 kt. The storm began to weaken with the intrusion of cold air, near the 40th parallel, on the 19th. However, late in the day the PRAIRIE GROVE, 150 mi. north of the center reported 60-kt. winds while battling 30-ft. seas. Early the next day the STEEL VENDOR, some 360 mi. northwest of the storm's center, encountered 64-kt. winds while also struggling in 30 ft. seas. During the day maximum winds decreased to 55 kt. as the storm became extratropical. The LOW remained intense as it traversed the eastern Pacific, finally moving into western Canada on the 24th.

MARIE, OCTOBER 29-NOVEMBER 4

Typhoon Marie began as a tropical depression, late on the 29th, near 14° N., 168° E. Moving west-northwestward at a forward speed of about 15 kt., the depression reached tropical storm strength early the following day when maximum winds increased to 40 kt. and central pressure dropped to 995 mb. Before the day was through Marie attained typhoon intensity, generating 65-kt. winds around a 983-mb. pressure center. The typhoon continued to intensify, as it moved on a west-northwesterly course, and by early on November 1, maximum winds were up to 85 kt. while central pressure dipped to 974 mb. Late in the day Marie, generating 100-kt. winds around a 960-mb. pressure center, began to recurve northward. On the 2d, Maintaining its 100-kt. winds, the typhoon crossed the 25th parallel near 152° E., on a northeastward heading. The typhoon reached its peak intensity early on the 3d when the pressure dropped to 946 mb. while winds remained at 100 kt. The forward speed increased to 45 kt. by late in the day and, with the intrusion of cold air, the storm began to weaken. Early on the 4th near 34° N., 167° E., the storm became extratropical. The pressure was 972 mb. and the storm was still generating 75-kt. winds. However, late in the day the LOW was absorbed by a larger extratropical storm.

PAMELA, DECEMBER 25-31

Back in mid-May typhoon Irma, the second typhoon of the season, battered the central Philippine Islands with 120-kt. winds, causing widespread destruction and many deaths. This area was spared the fury of another typhoon until the day after Christmas when typhoon Pamela roared through the central Islands, pounding the area with 90-kt. winds. The death toll stands at 30. Damage was estimated in the millions of dollars with many fishing boats sunk and crops and property destroyed.

Typhoon Pamela organized as a tropical storm some 220 mi. east of Samar, in the central Philippines, on the 25th of December. The storm, intensifying as it moved west-northwestward, reached the Samar coast on the 26th. Maximum winds reached 90 kt. near the center just prior to landfall at Samar, later the same day. On the 27th Pamela continued to batter the central Philippines as it island-hopped westward, finally departing the Philippines via Mindoro late in the day.

The rugged island journey had exhausted much of the storm's energy and maximum winds were now at 65 kt. Pamela continued to weaken as it traversed the South China Sea on a westerly course. At 0000 on the 30th the USNS UPSHUR, 600 mi. northeast of the center recorded winds of 50 kt. and 19ft. seas. Later in the day the tropical storm staggered ashore just south of Da Nang, Vietnam, and quietly dissipated.

RED RIVER OF THE NORTH BASIN FLOOD, MARCH - MAY 1966

Elmer R. Nelson
Office of Hydrology, Weather Bureau

Introduction

Severe flooding began in the Red River of the North Basin during March, causing considerable property damage along the smaller tributaries with near record to record crests during April. At Grand Forks, N. Dak., the main stem crested slightly higher than in 1965, but 4.6 feet lower than the record crest of 1897. At Drayton, N. Dak., the Red exceeded the previous record crest by 1.7 feet. The total damages from the flooding were estimated at $12.3 million.

Description of Basin

The Red River of the North rises in the Lake region of west-central Minnesota, not far from the headwaters of the Mississippi River. (See Figure 1). It is formed by the confluence of the Ottertail and Boise de Sioux Rivers, and then flows northward 400 miles to the Canadian border, forming the boundary between Minnesota and North Dakota. It is the largest northward flowing river in the United States. In Canada it flows generally northeastward about 155 miles into Lake Winnipeg which empties into Hudson Bay through the Nelson River.

The main river valley is very flat, varying in width from about 15 miles in the south to about 150 miles at the northern end. The slope of the river varies from about 1.3 feet per mile at the source to 0.2 foot per mile near the Canadian boundary and averages about 0.5 foot per mile. It is navigable along the greater portion of its course. On the east and west, the central plain is flanked by rougher uplands 300 to 700 feet higher.

Several tributaries flow into the Red River of the North from North Dakota and Minnesota. The most important of these are the Sheyenne and the Pembina in North Dakota (the Pembina rises in the province of Manitoba, Canada) and the Red Lake River in Minnesota.

The Red River of the North at the international boundary drains an area of about 40,200 square miles. Of this area, 21,000 square miles are in North Dakota, 16,400 in Minnesota, 800 in South Dakota, and 2,000 in Canada. The greater part of this Canadian area is drained southeastward into the United States by the Pembina River, which joins the Red River of the North, south of the Canadian border. Included in the total drainage area are 3,800 square miles of closed basins in North Dakota.

The greater portion of the Red River of the North Basin has been submerged twice beneath the sea and was once covered with an extensive glacial drift which left an immense lake called Lake Agassiz that had an outlet to the Mississippi River. The Lakes of Manitoba are the remains of this vast water body. Streams within the valley have flat slopes and channels which are generally inadequate to carry flood flows. An extensive system of drainage ditches has been constructed in North Dakota and Minnesota to assist nature in carrying away the water.

Climatology of the Basin

The Red River of the North Basin lies in the belt of prevailing westerly winds where the major rainfall occurs during the late spring and summer, with the greatest amount occurring in June. Approximately 60% of the total annual precipitation shown in Figure 1 occurs during the growing season which has an average lenght of 100 to 140 days. The winter months, December through February, are normally the driest months in the year. Approximately 15 percent of the total annual precipitation occurs during this period in the form of snow and accumulates to considerable depths in the valleys and wooded ares. The average annual precipitation varies from about 24 inches in the headwaters to 17 inches in the northern part. (Figure 1).

The mean annual temperature of the basin varies from about 43° F in the south to 36°F in the northern portion. Temperature extremes of 118° to -54° have been recorded.

The annual runoff in this part of the country is small. It averages about 3 to 4 inches per year in Minnesota to less than 1 inch in eastern North Dakota.

Previous Floods of the Basin

General

Official records for the Red River of the North Basin are sufficiently comprehensive to define all major floods since 1897. These records are antedated by approximately 70 years of documentary information in the form of newspapers and journals left by early travelers and settlers. These documents establish the fact that the flood of 1826 was the greatest of record. Francis Heron, Clerk of the Hudson's Bay Company recorded a day-by-day-account of this flood in the vicinity of Winnipeg. It appears the Red River was above bankfull from May 4 to July 5, 1826. It is quite probable the stage at Grand Forks was approximately 53.5 feet, present gage and datum. The second greatest flood of legendary record is that of 1852. It may have exceeded 51 feet at Grand Forks. Similar conditions existed in 1861. The flood of 1897 still stands as the highest of record in the reach from Wahpeton, N. Dak., to Grand Forks, N. Dak. Seasonal occurrence of floods in the Red River of the North is significant. Nine of the 12 highest floods of record at Fargo-Moorhead and 10 of the 12 highest floods of record at Grand Forks occurred during April. Table 2 shows comparative crest stage data of major floods in the basin from 1897 to 1966 and the period of flooding during 1966. Table 3, lists major floods in order of magnitude at selected locations along the Sheyenne, and Red Lake Rivers and the Red River of the North.

Causes and Development of 1966 Floods

Precipitation during the fall months (October through December) averaged generally above normal on the Minnesota side of the Red River of the North above the mouth of the Sheyenne River. Precipitation over the Wild Rice Basin was heavy and ranged to over 3 inches above normal. Across the rest of the basin, precipitation during the fall months averaged generally below normal with the greatest deficiency (up to 0.7 inch) being in the Sheyenne Basin. See Figure 2.-Total Precipitation for Period October 1965 through December 1965.

Precipitation during January and February 1966 averaged below normal over the greater portion of the Red River of the North Basin. In the Wild Rice Basin, in Minnesota, precipitation averaged up to .18 inch above normal and also slightly above normal over the Park River Basin in North Dakota. See Figure 3.-Total Precipitation for Period January and February 1966.

The depth of snow on the ground and its water equivalent in inches as of March 1, 1966 are given in Figure 4. The depth of the snow on the ground ranged from 1 inch in the headwaters to 20 inches in the northeastern portion of the basin. The water equivalent of the snow ranged from 0.5 inch in the headwaters to 5.5 inches over Two Rivers Basin in northwestern Minnesota.

One of the worst blizzards of the century to hit the Red River of the North Basin began as a low pressure area over the Northern Rockies on March 1. The deepening storm became a blizzard on March 2 as it traveled slowly across the Northern Plains accompanied by heavy snowfalls and 70 m.p.h. winds. The blizzard continued until March 5. Figure 5 shows the depth of the snow on the ground after the end of this severe snowstorm. The depth of the snow ranged from 15 inches in the headwaters to 40 inches in the northeastern portion of the basin.

Water equivalent measurements were made of the snow cover as of March 8. Figure 6 shows water equivalent of the snow ranged from 0.5 inch in the headwaters to 6.5 inches in the reach at and above Grand Forks, N. Dak., with the highest amounts being on the Minnesota side. The depth of the snow cover at the time of the survey is also shown.

Figures 7, 8 and 9 show the depth of the snow as of March 15, 25 and 31. The only snow remaining on the ground at the end of March was in the northeastern portion of the basin where depths ranged from 1 to 9 inches.

The total precipitation during March and April, compared with normal, is shown in Figures 10 and 11. During March, it averaged above normal at all points except in the extreme headwaters at Wheaton, Minn. The greatest positive departures from normal during March were 3.77 inches in the Goose River Basin in North Dakota and 3.73 inches in the Wild Rice Basin in Minnesota. During April, the precipitation averaged above normal except in the lower portion of the Sheyenne River Basin in North Dakota and in the lower portion of the Red Lake Basin in Minnesota. The greatest positive departure from normal was 2.27 inches at Park River, N. Dak.

The daily precipitation during March and April in the Red River of the North Basin is shown in Table 1. Most of the precipitation during March occurred during the severe snowstorm of March 3-5, 1966.

The daily temperatures and degree days above 32°F for selected stations during March and April 1966 is given in Table 4.

Spring Flood of 1966

Record to near record floods occurred during the spring in the Red River of the North Basin. The flood crests of 1966 were generally higher than the flood of 1965 except at and above Fargo, N. Dak., and along the Red Lake River in Minnesota.

River stage hydrographs for 9 stations during March to May 1966 are shown in Figures 12 to 14. The crest along the main stem traveled from Wahpeton, N. Dak., on March 16 to Pembina, N. Dak., by April 11-12, a distance of 391 miles. A comparison of the 1966 crests with the highest crests on record are shown in these illustrations.

March 1966

Flooding began along the main stem of the Red River of the North at Wahpeton, N. Dak., on March 14. The crest of 13.94 feet on March 16 was the 7th highest stage of record (Table 3). It was 0.4 foot lower than the 14.3 feet crest reported on April 11, 1965. As the main stem was cresting at Wahpeton, N. Dak., it began overflowing its banks at Fargo, N. Dak., (Figure 13). The following day, March 17, the Sheyenne River went out of its banks at West Fargo, N. Dak., (Figure 12). Flooding along the Red River of the North extended to Halstad, Minn., on March 20 (Figure 13) and to Grand Forks, N. Dak., by the evening of March 21 (Figure 14). The Sheyenne River crested at West Fargo, N. Dak., on March 22-23 at a stage of 21.04 feet (flood stage 16 feet). This was 0.2 foot lower than in April 1965. The main stem crested at Fargo, N. Dak., on March 23 at a stage of 30.10 feet (Flood stage, 17 feet). This was the seventh highest stage of record. A crest of 35.48 feet occurred at Halstad, Minn., on March 27. This was 11.5 feet above flood stage and slightly higher (0.1 foot) than in April 1965. The Red River of the North began overflowing at Drayton, N. Dak., on March 28 and on the Red Lake River at Crookston, Minn., on March 31. The Sheyenne, Red Lake, and the Red River of the North were still in flood at the end of March, except the Red River of the North at Wahpeton, N. Dak., where it receded within its banks on March 20. At Pembina, N. Dak., the river had risen to within 4 feet of flood stage by midnight on March 31.

April-May 1966

The Sheyenne River at West Fargo, N. Dak., was at a stage of 19.6 feet (flood stage 16 feet) on April 1 and rising slowly. It rose 0.8 foot before cresting on April 3 at a stage of 20.36 feet. This was 0.7 foot below the record crest of 21.04 feet which occurred during the previous month and 0.4 foot below the previous highest stage of record established in April 1965. It receded within its banks on the morning of April 12.

The Red Lake River at High Landing, Minn., crested at a stage of 12.43 feet on April 3. This was 2.35 feet higher than the 10.08 feet crest of the previous month and 1 foot lower than the record 13.42 feet crest of May 1950. Farther downstream at Crookston, Minn., the Red Lake River reached a crest of 24.34 feet on April 3. This was 1.5 feet lower than the record crest of 1965.

The main stem of the Red River of the North at Wahpeton, N. Dak., remained nearly stationary at 6 feet during the first 18 days of April. It began rising on April 19 and continued rising until April 30 when it reached a crest of 8.76 feet, (Flood stage, 10 feet).

In the reach from Fargo, N. Dak., to Halstad, Minn., the Red River of the North was 6 to 10 feet above flood stage and receding on April 1. The crest of 30.10 feet at Fargo on March 23, 1966 was nearly 0.5 foot lower than the crest of 1965 and 10 feet lower than the record crest of 1897. It receded below flood stage on April 6 and continued below flood stage the remainder of April and May. At Halstad, Minn., the main stem receded below flood stage (24 feet) on April 9 and reached a level near 9 feet on April 22.

At Grand Forks, N. Dak., the river continued rising until April 4 when it reached a crest of 45.63 feet. This was 17.6 feet above flood stage and 1.7 feet above the 1965 flood level. It approached within 4.6 feet of the record 1897 level. It continued receding to about 4 feet below flood stage on April 24. The main stem rose to bankfull level (28 feet) again by midnight of April 30 and crested at a stage of 29.54 feet on May 3. It receded below flood stage on May 6.

At Drayton, N. Dak., the Red River of the North rose to a record stage of 42.15 feet on April 8, (flood stage, 32 feet), exceeding the previous highest stage of 40.4 feet of April 1965. It receded below flood stage on May 11.

At Pembina, N. Dak., the river rose to a near record crest of 51.30 feet on April 11-12, 1966. This was 9.3 feet above flood stage and 1.6 feet below the previous record stage of May 1950. It receded below flood stage on April 30.

Comparison with the Floods of 1897 and 1950

Figure 15 shows a comparison of the flood of 1966 at Grand Forks, N. Dak., with the floods of 1897 and 1950. The flood crest of 1966 occurred earlier than the ones of 1897 and 1950 by 6 and 37 days,respectively. The crest of 1966 at Grand Forks was 0.02 foot higher than the one of 1950, but 4.6 feet lower than the crest of 1897. The flood of 1966 was the shortest, lasting 25 days compared to 28 days in 1897 and 54 days in 1950.

Flood Warnings Issued By ESSA, Weather Bureau

The Spring Flood Outlook for the Red River of the North was issued by ESSA, Weather Bureau on March 9, 1966, only a few days after the severe blizzard of March 3-5, 1966. This outlook indicated crest stages near those of 1965 at and below Halstad, Minn. These forecasts assumed a normal temperature pattern and light precipitation during the following 5 weeks with the absence of ice jams.

On March 15, 1966, the forecast was revised with crests in the reach at and below Grand Forks, N. Dak., expected to exceed the crests of 1965. A further refinement was made in forecasts on March 18, 20 and 21. The observed crests exceeded 1965 levels by 0.1 foot to 3.9 feet from Halstad, Minn., to Pembina, N. Dak., during the period March 27 to April 12. Ice action did influence stages from above Drayton to Wahpeton, N. Dak.

River forecasts and related data were relayed to Canadian officials under an existing cooperative agreement during the flood. Dikes in all towns and municipalities in southern Manitoba were raised in anticipation of flood crests. The forecasts issued about 3 weeks prior to the flood were valuable to the municipalities and individuals in the area.

Flood Damages

The total cost of the 1966 flood in the Red River of the North Basin has been estimated at $12.3 million. Of this total, $8 million damages occurred in North Dakota and $4.3 million in Minnesota. These preliminary figures on flood damage and cost of protection were based on estimates received from the Corps of Engineers.

Flood fighting costs were highest downstream from Fargo, N. Dak. The city of Grand Forks, N. Dak., spent $400,000 and the city of East Grand Forks, N. Dak., spent $500,000 for protection against flooding. The two cities were determined to avoid a repetition of the severe flooding of 1965. After the severe blizzard of March 3-5, 1966, an expanded program against expected high water was started immediately. In both cities the snow was removed from areas in which dikes were to be built. Sand for filling burlap bags was stockpiled for building dikes. School children, University of North Dakota students, Air Force personnel and citizens of the two cities responded to pleas to help build the dikes. Water spread across golf courses, parks, roads and rich farmlands, but the dikes throughout the Greater Grand Forks area held as did most of those throughout the valley. Many families left their homes as a precaution against a sudden break in the emergency walls, but relatively few homes were flooded. At town after town volunteers turned out to build dikes to protect the area from flood damage. At Alvarado, Minn., the Snake River overflowed its banks with such suddenness that emergency dikes could not be completed in time. Water several inches to several feet deep flowed around homes and business places throughout the village. About 2,800 persons were evacuated in 3 Manitoba towns as the flood rolled northward to Winnipeg.

Damage to rural areas, chiefly flooded land which totalled 920,000 acres, was heavy. Agricultural damage was estimated at $7.7 million. Transportation losses, such as roads and bridges, were estimated at $1.5 million for North Dakota and Minnesota. Urban damages were estimated at $3.1 million.

Savings

An estimated $1 million dollars was saved through the early issuance of the Spring Flood Outlook by the Weather Bureau. Advance warning and accurate forecasts gave municipalities the needed time to construct dikes and protect the cities against flooding. No deaths were reported as resulting from the major flooding. Canadian officials were complimentary of the assistance, data, and forecasts given them by the Weather Bureau during the flood.

Acknowledgments

Acknowledgments are due the following:

Weather Bureau, Central Region, Kansas City, Mo.

1. Verne Alexander, Regional Hydrologist, for coordination of field data.
2. E. Vernon Hendrickson, Meteorologist in Charge, Weather Bureau Office, Fargo, N. Dak., for forwarding data on the flood.

Other Governmental Agencies

1. U. S. Corps of Engineers, St. Paul, Minn., for information on flood damages.
2. U. S. Geological Survey, Bismarck, N. Dak., and St. Paul, Minn., for information on tributary flow and supplemental gage height data.

MAJOR FLOODS IN ORDER OF MAGNITUDE

Red River of the North Basin

SHEYENNE RIVER

West Fargo, N. Dak.
Zero of gage - 877.19 feet
Drainage area - 8,870 square miles a/
Flood Stage - 16 feet
Period of record - 37 years (referred to present site and datum 1929-1966)

Crest Stage	Date
Feet	
21.04	March 22-23, 1966
20.75	April 19, 1965
20.61	May 11, 1950
20.53	April 18, 1947
#20.5	April 9-10, 1952
20.36	April 3, 1966
19.35	April 1, 1943
18.83	June 20, 1953
18.46	May 7, 1948

RED LAKE RIVER

High Landing, Near Goodridge, Minn.
Zero of gage - 1,141.57 (1912 adj.)
Drainage area - 2,300 square miles
Flood stage -
Period of record - 1930-1966 (referred to present site and datum)

Crest Stage	Date
Feet	
13.42	May 11, 1950
12.43	April 3, 1966

RED RIVER OF THE NORTH (Cont'd.)

Grand Forks, N. Dak. (Cont'd.)

Crest Stage Feet	Date
41.7	April 16, 1948
41.0	April 17, 1916
41.0	March 29, 1920
40.7	April 22, 1947
40.6	April 27, 1904 and April 28, 1883

Drayton, N. Dak.
Zero of gage - 755.00 feet (1929 adj.)
Drainage area - 34,800 square miles a/
Flood stage - 32 feet
Period of record -

Crest Stage Feet	Date
42.15	April 8, 1966
40.4	April 22, 1965
39.99 b/	May 12, 1950
39.4 b/	April --, 1897

RED RIVER OF THE NORTH (Cont'd.)

Drayton, N. Dak. (Cont'd.)

Crest Stage Feet	Date
39.3 b/	April 26, 1950
38.46 b/	April 22, 1948
32.1 b/	April 17-19, 1943
31.5 b/	April 28, 1947
27.2 b/	April 26, 1952

Pembina, N. Dak.
Zero of gage -
Drainage area -
Flood stage - 42 feet
Period of record -

Crest Stage Feet	Date
52.9	May 14, 1950
51.7	May 1, 1950
51.3	April 11-12, 1966
48.5 (4)	April 27, 1948
47.4	April 25, 1965

a/ Includes 3,800 square miles in closed basins
b/ Adjusted to present datum
Highest reported
(1) From high water mark
(2) Prior to gage records
(3) Legendary Flood of 1852 probably was higher by 3/10 foot or more
(4) Estimated from data for Emerson, Manitoba
(5) Excludes 3,800 square miles in closed basins

GENERAL SUMMARY OF FLOOD LOSSES FOR 1965

Elmer R. Nelson and Raymond J. Haley
Office of Hydrology, Weather Bureau

Monetary losses from floods in the United States during 1965, estimated at $785 million, were 1.2 times greater than in 1964 and 4.4 times greater than in 1963. This is the highest damage sustained from floods since 1955 when the losses totaled $995 million. In comparison with the national average of $400 million, based on the 15-year period 1951 to 1965 (adjusted to the 1965 price index), the flood loss in 1965 was 196 percent.

The total loss of life in 1965 from floods was 119 compared to 100 in 1964 and 39 in 1963. This is the highest loss of life since 1955 when 302 lives were lost. In comparison with the national average of 80 lives lost during the last 41 years (1925 to 1965), it was 1.5 times greater.

The floods during June in the South Platte, Arkansas, and Rio Grande Basins caused property damage estimated at $476 million and a loss of 58 lives. The most destructive of these floods occurred in the South Platte Basin in eastern Colorado where the total damages were estimated at $415 million. In comparison with the total flood damages over the entire Country during 1965, the flood loss in these three basins during June accounted for 61 percent of the loss. Nearly one-half of the total loss of life from floods during the year occurred during June in this comparatively small area. The greatest toll of life occurred in the flash flood at Sanderson, Tex., on June 11 when 26 lives were lost.

The savings resulting from the Weather Bureau Flood Forecasting Service in 1965 were, as compiled from fragmentary information, approximately $200 million. The U. S. Corps of Engineers, Rock Island, Illinois, District estimated savings from flood warnings in their district at $178 million.

The most important floods during 1965 were the spring floods in the Upper Mississippi, Missouri, and Red River of the North Basins; and the floods during June in the South Platte, Arkansas, and Rio Grande Basins.

The flooding along the upper Mississippi River was the greatest in more than 100 years. Loss of life and property was minimized by protective action taken as a result of advance warnings. Property damages in the Upper Mississippi, Missouri, and the Red River of the North Basins during the spring floods totaled $181 million, with a toll of 16 lives.

ANNUAL FLOOD LOSSES FOR U. S. . .

Annual Flood Losses and Savings for years 1933 to 1947, inclusive, have been published in the Monthly Weather Review as follows:

Year	Issue of Review	Pages
1933	Vol. 62, No. 1, Jan. 1934	25-27
1934	Vol. 62, No. 12, Dec. 1934	465-467
1935	Vol. 63, No. 12, Dec. 1935	362-365
1936	Vol. 65, No. 1, Jan. 1937	28-31
1937	Vol. 66, No. 12, Dec. 1938	426-430
1938	Vol. 68, No. 9, Sep. 1940	262-263
1939	Vol. 68, No. 11, Nov. 1940	329-330
1940	Vol. 69, No. 7, Jul. 1941	217-218
1941	Vol. 71, No. 11, Nov. 1943	185-186
1942 & 1943	Vol. 73, No. 8, Aug. 1945	137-139
1944 & 1945	Vol. 76, No. 6, Jun. 1948	113-116
1946	Vol. 76, No. 9, Sep. 1948	208-210
1947	Vol. 77, No. 9, Sep. 1949	262-265

Beginning with flood losses for the year 1948, annual flood loss data are published in Climatological Data, National Summary, as follows:

Year	Issue of Climatological Data
1948	August 1950
1949	Annual 1950
1950) 1951)	Annual 1951
1952	Annual 1952
1953	Annual 1953
1954	Annual 1955
1955	Annual 1956
1956	Annual 1957
1957	Annual 1958
1958	Annual 1959
1959	Annual 1960
1960	Annual 1961
1961	Annual 1962
1962	Annual 1963
1963	Annual 1964
1964	Annual 1965

Prior to 1933 Flood Losses and Savings were published monthly, as a rule, in the Monthly Weather Review.

A. On Monocacy R. near Frederick - no damage on Monocacy.
B. Only very minor damage.
C. Includes all urban damage.
D. Includes all rural damage.
E. Coordinated with U. S. Engineers.
F. Includes public utilities damage.
G. Includes all residential damage.
H. Includes all commercial damage.
I. Includes all crop and land damages.
J. Estimates by Tennessee Valley Authority.
K. Includes all residential and commercial.
L. Agricultural losses.
M. Includes all rural losses except crop.
N. 13 in Minnesota and 2 in Iowa during Spring flood in upper Mississippi Valley.

* Major Flood in May 1956

** Major Flood in June 1961

*** Ice Jam Flooding May 1962

*** Serious Flooding June 1962

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
YEAR 1966

Elmer R. Nelson
Office of Hydrology, Weather Bureau

The most catastrophic floods during 1966, with respect to loss of life, were the flash floods in the Trinity and Sabine Basins in northeastern Texas during April. The American Red Cross reported that 27 lives were lost due to drowning in these floods. Flood damages were heavy and in excess of $15 million in the upper Trinity alone.

A special report is published in this issue on the record to near record floods of March to May in the Red River of the North Basin. The total flood damages in this basin were estimated at $12.3 million.

This report contains a brief summary by months of the most significant flooding during 1966. A detailed summary of flooding during 1966 appears in the monthly issues of this publication.

January

Damaging floods occurred along tributary streams in the White Basin in Arkansas. Flooding on the Black River was the most severe since 1927. Heavy damages occurred to public property and roads in Arkansas. Many families were evacuated. Extensive flooding occurred along the Cache River at Patterson, Ark. The damages to public and private property was the greatest in several years.

Major flooding occurred along northern California streams. In the north-west considerable damage resulted from the flooding along the Trinity, Smith, and Eel Rivers. Many families had to leave their homes.

February

The rise in the Upper Mississippi Basin was the highest of record. The Rock River at Joslin, Ill., exceeded the previous record crest of March 1948. The third highest crest of record occurred on the Mississippi River at Davenport, Iowa, due to an ice jam. Flood damage in the Quad City area was estimated at near $1 million.

Many streams in the East Gulf of Mexico Drainage reached the highest level since April 1964. The damages along the Alabama River were mostly agricultural and totalled close to $1 million. Flood damage along the Pearl River in Mississippi was limited to agriculture and to the stoppage of construction of highway and levee projects. The total damages equalled nearly $3/4 million.

March

Severe flooding in the Red River of the North Basin continued into April and May. The Sheyenne River reached a record crest at West Fargo, N. Dak. The Red River of the North at Halstad, Minn., reached a near record crest.

The main stem of the Mississippi reached a record high stage at Fort Ripley, Minn., exceeding the previous record stage of April 1965. Flooding elsewhere in the Upper Mississippi Basin was mostly minor in comparison to the spring of 1965.

In the East Gulf of Mexico Drainage, the Flint River in Georgia reached its highest stage in 18 to 36 years at various points. The Apalachicola River at Blountstown, Fla., reached its second highest stage of record.

April

Near record to record crests occurred in the Red River of the North Basin. At Grand Forks, N. Dak., the crest ranked among the third highest of record. At Drayton, N. Dak., the Red River of the North exceeded the previous record crest by 1.7 feet. The total damages from the near record to record spring flooding in the Red River of the North Basin was estimated at $12.3 million.

Severe flash flooding occurred in northeastern Texas in the Sabine and Trinity Basins. Joe's Creek at Dallas, Tex., crested 2 feet higher than the highest flood since 1900. Bachman Branch at Dallas crested 5 feet higher than the highest known flood. Preliminary estimates of flood damage in the upper Trinity are in excess of $15 million. The American Red Cross reported 27 deaths due to drowning from flash floods in the Sabine and Trinity River Basins in Texas.

The worst flooding since 1961 occurred in the White Basin in Arkansas. Severe flooding occurred in the Red Basin in Arkansas with the Ouachita and tributaries reaching their highest stage since 1958. The total preliminary damages were estimated at over $2.5 million.

May

Flash floods occurred in sections of Georgia, Illinois, and West Virginia. Extensive damage resulted to streets, roads, bridges, yards, and buildings along the Oconee River in the Athens, Ga., area. At Morris, Ill., the Aux Sable Creek flooded portions of the city to depths up to 3 to 4 feet. Flood damages along the West Fork, Cheat, and Tygart Rivers in West Virginia were minor.

The worst flooding since 1961, which began in the White Basin in Arkansas during April, continued into May. Severe flooding occurred on the Ouachita River and tributaries in Arkansas and on the Sabine and Trinity Rivers in Texas.

June

Damaging floods occurred along small creeks in southeastern Iowa, southwestern North Dakota, and south-central Nebraska. Crests ranking second to third highest were recorded in the Skunk River Basin in Iowa. The most serious flooding occurred on the North Skunk at Sigourney, Iowa, which crested nearly 8 feet above flood stage. This crest was the second highest of record. Sappa Creek at Stamford, Nebr., exceeded the previous highest stage of record reached in 1947 by nearly 2 feet.

Severe flash flooding occurred in the southwestern quadrant of North Dakota from excessive rains on June 24. About one-third of the population of Center, N. Dak., had to be evacuated. Big Muddy Creek flooded the entire town of Almont, N. Dak. The entire population was evacuated before the flood. The flash flooding of small creeks flowing into the Knife and Heart Rivers were considered as the most severe in history.

July

Flash flooding occurred in the extreme upper Frio

River and tributaries in Texas. Flood warnings were issued so that vacationers and other persons could be evacuated from low-lying areas.

August

Record to near record flooding occurred on streams in east-central Nebraska. Several communities reported severe damage. Water stood 17 feet deep in low places at Fullerton, Nebr. Preliminary estimates of damage were placed at over $2.2 million. There was no loss of life reported.

Major flooding occurred in southeastern New Mexico in the Pecos Basin. This flood approached the severity of the flood of October 1904, when the Avalon Dam, 5 miles upstream from Carlsbad failed. Property damage was heavy and hundreds of persons were evacuated. At least two lives were lost due to drowning. Three counties were declared disaster areas.

Severe flash flooding occurred in the Frio River Basin in Texas. The Dry Frio at Regan Wells, Tex., reached its highest stage since 1880. Five thousand persons, mostly campers were evacuated. There was no loss of life reported.

September

The most significant flooding occurred in the Rio Grande Basin in Texas. Heavy damages resulted to crops. Total damages were estimated at $1/2 million.

Severe flash flooding occurred on small streams in New Jersey. The Elizabeth River at Elizabeth, N. J., (drainage area 20.2 sq. mi.) reached its highest peak in 45 years of record. The city of Elizabeth was declared a disaster area.

October

Flash flooding occurred on small streams in New Jersey for the second consecutive month.

November

Flash floods occurred on small streams in Maine and northern New Hampshire during November. A record-breaking flood occurred on the Piscataquis River and moderate flooding on the Kennebec and Androscoggin Rivers in Maine. The total damages from flooding in Maine was estimated at $1/2 million.

December

Severe flooding occurred in southern California. Flooding along the Kaweah, Tule, and Kern Rivers was the highest of record. The peak flow of the Tule River at Success Dam was more than twice the previous record and on the Kern River at Isabella Reservoir about 2.5 times its previous record. The greatest devastation occurred above the dams. Many homes and several trailer courts were destroyed. Communities in the foothills were isolated and helicopter rescue and supply lines were established by the Military over a 2-day period. Streams in the Salinas Basin reached record heights. The crest at Bardley, Calif., was 3.5 feet higher than the previous record established in April 1958. Preliminary estimates of flood damage in southern California were placed at $20.5 million.

Major flooding occurred in northern Arizona, southern Nevada, and southwestern Utah. Flooding on the Virgin River was one of the largest floods on record. Preliminary estimates of flood damage were placed at nearly $5 million.

* May to September are corrected values, superseding previously published data.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code ʌ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

The spectrophotometer measures the total amount of ozone in the atmosphere, i e , the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g , 350 milli-atmo-cm ozone implies an ozone layer 0 350 centimeter thick The code λ s designates the type of measurement made
